## 7 — Abstract —

8 Infinitary and regular proofs are commonly used in fixed point logics. Being natural intermediate  
9 devices between semantics and traditional finitary proof systems, they are commonly found in  
10 completeness arguments, automated deduction, verification, etc. However, their proof theory  
11 is surprisingly underdeveloped. In particular, very little is known about the computational  
12 behavior of such proofs through cut elimination. Taking such aspects into account has unlocked  
13 rich developments at the intersection of proof theory and programming language theory. One  
14 would hope that extending this to infinitary calculi would lead, *e.g.*, to a better understanding of  
15 recursion and corecursion in programming languages. Structural proof theory is notably based  
16 on two fundamental properties of a proof system: cut elimination and focalization. The first  
17 one is only known to hold for restricted (purely additive) infinitary calculi, thanks to the work  
18 of Santocanale and Fortier; the second one has never been studied in infinitary systems. In  
19 this paper, we consider the infinitary proof system  $\mu\text{MALL}^\infty$  for multiplicative and additive  
20 linear logic extended with least and greatest fixed points, and prove these two key results. We  
21 thus establish  $\mu\text{MALL}^\infty$  as a satisfying computational proof system in itself, rather than just an  
22 intermediate device in the study of finitary proof systems.

## 23 1 Introduction

24 Proof systems based on non-well-founded derivation trees arise naturally in logic, even more  
25 so in logics featuring fixed points. A prominent example is the long line of work on tableaux  
26 systems for modal  $\mu$ -calculi, *e.g.*, [16, 24, 14, 11], which have served as the basis for analysing  
27 the complexity of the satisfiability problem, as well as devising practical algorithms for solving  
28 it. One key observation in such a setting, and many others, is that one needs not consider  
29 arbitrary infinite derivations but can restrict to *regular* derivation trees (also known as *circular*  
30 proofs) which are finitely representable and amenable to algorithmic manipulation. Because  
31 infinitary systems are easier to work with than the finitary proof systems (or axiomatizations)  
32 based on Kozen-Park (co)induction schemes, they are often found in completeness arguments  
33 for such finitary systems [16, 27, 28, 29, 15, 12]. We should note, however, that those  
34 arguments are far from being limited to translations from (regular) infinitary to finitary  
35 proofs, since such translations are very complex and only known to work in limited cases.  
36 There are many other uses of infinite (or regular) derivations, *e.g.*, to study the relationship  
37 between induction and infinite descent in first-order arithmetic [8], to generate invariants for  
38 program verification in separation logic [7], or as an intermediate between ludics' designs  
39 and proofs in linear logic with fixed points [5]. Last but not least, Santocanale introduced  
40 circular proofs [22] as a system for representing morphisms in  $\mu$ -bicomplete categories [21, 23],  
41 corresponding to simple computations on (co)inductive data.

42 Surprisingly, despite the elegance and usefulness of infinitary proof systems, few proof  
43 theoretical studies are directly targetting these objects. More precisely, we are concerned  
44 with an analysis of proofs that takes into account their computational behaviour in terms

of cut elimination. In other words, we would hope that the Curry-Howard correspondence extends nicely to infinitary proofs. In this line of proof-theoretical study, two main properties stand out: cut elimination and focalization; we shall see that they have been barely addressed in infinitary proof systems. The idea of cut elimination is as old as sequent calculus, and at the heart of the proof-as-program viewpoint, where the process of eliminating cuts (indirect reasoning) in proofs is seen as computation. Considering logics with least and greatest fixed points, the computational behavior of induction and coinduction is recursion and corecursion, two important and complex programming principles that would deserve a logical understanding. Note that the many completeness results for infinitary proof systems (*e.g.*, for modal  $\mu$ -calculi) only imply cut admissibility, but say nothing about the computational process of cut elimination. To our knowledge, leaving aside an early and very restrictive result of Santocanale [22], cut elimination has only been studied by Fortier and Santocanale [13] who considered an infinitary sequent calculus for lattice logic (purely additive linear logic with least and greatest fixed points) and showed that certain cut reductions converge to a limit cut-free derivation. Their proof involves a mix of combinatorial and topological arguments. So far, it has resisted attempts to extend it beyond the purely additive case. The second key property, much more recently identified than cut elimination, is focalization. It has appeared in the work of [3] on proof search and logic programming in linear logic, and is now recognized as one of the deep outcomes of linear logic, putting to the foreground the role of *polarity* in logic. In a way, focalization generalizes the invertibility results that are notably behind most deductive systems for classical  $\mu$ -calculi, by bringing some key observations about non-invertible connectives. Besides its deep impact on proof search and logical frameworks, focalization resulted in important advances in all aspects of computational proof theory: in the game-semantical analysis of logic [17, 19], the understanding of evaluation order of programming languages, CPS translations, or semantics of pattern matching [10, 30], the space compression in computational complexity [26, 6], etc. Briefly, one can say that while proof nets have led to a better understanding of phenomena related to parallelism with proof-theoretical methods, polarities and focalization have led to a fine-grained understanding of sequentiality in proofs and programs. To the best of our knowledge, while reversibility has since long been a key-ingredient in completeness arguments based on infinitary proof systems, focalization has simply never been studied in such settings.

*Organization and contributions of the paper.* In this paper, we consider the logic  $\mu\text{MALL}$ , that is multiplicative additive linear logic extended with least and greatest fixed point operators. It has been studied in finitary sequent calculus [4]: it notably enjoys cut elimination, and focalization has been shown to extend nicely (though not obviously) to it. We give in Section 2 a natural infinitary proof system for  $\mu\text{MALL}$ , called  $\mu\text{MALL}^\infty$ , which notably extends that of Santocanale and Fortier [13]. The system  $\mu\text{MALL}^\infty$  is also related to  $\mu\text{MALL}$  in the sense that any  $\mu\text{MALL}$  derivation can be turned into a  $\mu\text{MALL}^\infty$  proof, with cuts. We study the focalization of  $\mu\text{MALL}^\infty$  in Section 3. We find out that, even though fixed point polarities are not forced in the finitary sequent calculus for  $\mu\text{MALL}$ , they are uniquely determined in  $\mu\text{MALL}^\infty$ . Despite some novel aspects due to the infinitary nature of our calculus, we are able to re-use the generic *focalization graph* argument [20] to prove that focalized proofs are complete. We then turn to cut elimination in Section 4 and show that (fair) cut reductions converge to an infinitary cut free derivation. We could not apply any standard cut elimination technique (*e.g.*, induction on formulas and proofs, reducibility arguments, topological arguments as in [13]) and propose instead an unusual argument in which a coarse truth semantics is used to show that the cut elimination process cannot go wrong. We also note here that, even for the regular fragment of  $\mu\text{MALL}^\infty$ , it would be

highly non-trivial to obtain cut elimination from the result for  $\mu\text{MALL}$ , since it is not known whether regular  $\mu\text{MALL}^\infty$  derivations can be translated to  $\mu\text{MALL}$  derivations (even without requiring that this translation preserves the computational behaviour of proofs). We conclude in Section 5 with directions for future work. Appendices provide technical details, proofs, and additional background material.

## 2 $\mu\text{MALL}$ and its infinitary proof system $\mu\text{MALL}^\infty$

In this section we introduce multiplicative additive linear logic extended with least and greatest fixed point operators, and an infinitary proof system for it.

► **Definition 1.** Given an infinite set of propositional variables  $\mathcal{V} = \{X, Y, \dots\}$ ,  $\mu\text{MALL}^\infty$  *pre-formulas* are built over the following syntax:

$$\varphi, \psi ::= \mathbf{0} \mid \top \mid \varphi \oplus \psi \mid \varphi \& \psi \mid \perp \mid \mathbf{1} \mid \varphi \wp \psi \mid \varphi \otimes \psi \mid \mu X. \varphi \mid \nu X. \varphi \mid X \quad \text{with} \quad X \in \mathcal{V}.$$

The connectives  $\mu$  and  $\nu$  bind the variable  $X$  in  $\varphi$ . From there, bound variables, free variables and capture-avoiding substitution are defined in a standard way. The subformula ordering is denoted  $\leq$  and  $\text{fv}(\bullet)$  denotes free variables. Closed pre-formulas are simply called **formulas**. Note that negation is not part of the syntax, so that we do not need any positivity condition on fixed point expressions.

► **Definition 2.** *Negation* is the involution on pre-formulas written  $\varphi^\perp$  and satisfying  $(\varphi \wp \psi)^\perp = \psi^\perp \otimes \varphi^\perp$ ,  $(\varphi \oplus \psi)^\perp = \psi^\perp \& \varphi^\perp$ ,  $\perp^\perp = \mathbf{1}$ ,  $\mathbf{0}^\perp = \top$ ,  $(\nu X. \varphi)^\perp = \mu X. \varphi^\perp$ ,  $X^\perp = X$ .

Having  $X^\perp = X$  might be surprising, but it is harmless since our proof system will only deal with closed pre-formulas. Our definition yields, *e.g.*,  $(\mu X. X)^\perp = (\nu X. X)$  and  $(\mu X. \mathbf{1} \oplus X)^\perp = (\nu X. X \& \perp)$ , as expected [4]. Note that we also have  $(\varphi[\psi/X])^\perp = \varphi^\perp[\psi^\perp/X]$ .

Sequent calculi are sometimes presented with sequents as sets or multisets of formulas, but most proof theoretical observations actually hold in a stronger setting where one distinguishes between several *occurrences* of a formula in a sequent, which gives the ability to precisely *trace* the provenance of each occurrence. This more precise viewpoint is necessary, in particular, when one views proofs as programs. In this work, due to the nature of our proof system and because of the operations that we perform on proofs and formulas, it is also crucial to work with occurrences. There are several ways to formally treat occurrences; for the sake of clarity, we provide below a concrete presentation of that notion which is well suited for our needs.

► **Definition 3.** An *address* is a word over  $\Sigma = \{l, r, i\}$ , which stands for left, right and inside. We define a *duality* over  $\Sigma^*$  as the morphism satisfying  $l^\perp = r$ ,  $r^\perp = l$  and  $i^\perp = i$ . We say that  $\alpha'$  is a *sub-address* of  $\alpha$  when  $\alpha$  is a prefix of  $\alpha'$ , written  $\alpha \sqsubseteq \alpha'$ . We say that  $\alpha$  and  $\beta$  are *disjoint* when  $\alpha$  and  $\beta$  have no upper bound wrt.  $\sqsubseteq$ .

► **Definition 4.** A *(pre)formula occurrence* (denoted by  $F, G, H$ ) is given by a (pre)formula  $\varphi$  and an address  $\alpha$ , and written  $\varphi_\alpha$ . We say that occurrences are *disjoint* when their addresses are. The occurrences  $\varphi_\alpha$  and  $\psi_\beta$  are *structurally equivalent*, written  $\varphi_\alpha \equiv \psi_\beta$ , if  $\varphi = \psi$ . Operations on formulas are extended to occurrences as follows:  $(\varphi_\alpha)^\perp = (\varphi^\perp)_{\alpha^\perp}$ ; for any  $\star \in \{\wp, \otimes, \oplus, \&\}$ ,  $F \star G = (\varphi \star \psi)_\alpha$  if  $F = \varphi_{\alpha l}$  and  $G = \psi_{\alpha r}$ ; for any  $\sigma \in \{\mu, \nu\}$ ,  $\sigma X. F = (\sigma X. \varphi)_\alpha$  if  $F = \varphi_{\alpha i}$ ; we also allow ourselves to write units as formula occurrences without specifying their address, which can be chosen arbitrarily. Finally, *substitution of occurrences* forgets addresses:  $(\varphi_\alpha)[\psi_\beta/X] = (\varphi[\psi/X])_\alpha$ .

► **Example.** Let  $F = \varphi_{\alpha l}$  and  $G = \psi_{\alpha r}$ . We have, on the one hand,  $(F \otimes G)^\perp = ((\varphi \otimes \psi)_\alpha)^\perp = (\psi^\perp \wp \varphi^\perp)_{\alpha^\perp}$  and, on the other hand,  $G^\perp \wp F^\perp = (\psi^\perp)_{\alpha^\perp l} \wp (\varphi^\perp)_{\alpha^\perp r} = (\psi^\perp \wp \varphi^\perp)_{\alpha^\perp}$ . Thus,

$$\begin{array}{cccc}
\frac{\vdash F, \Gamma \quad \vdash G, \Gamma}{\vdash F \& G, \Gamma} (\&) & \frac{\vdash F, G, \Gamma}{\vdash F \wp G, \Gamma} (\wp) & \frac{\vdash F_i, \Gamma}{\vdash F_1 \oplus F_2, \Gamma} (\oplus_i) & \frac{\vdash F, \Gamma \quad \vdash G, \Delta}{\vdash F \otimes G, \Gamma, \Delta} (\otimes) \\
\frac{}{\vdash \top, \Gamma} (\top) & \frac{\vdash \Gamma}{\vdash \perp, \Gamma} (\perp) & \text{(no rule for } \mathbf{0} \text{)} & \frac{}{\vdash \mathbf{1}} (\mathbf{1}) \\
\frac{\vdash F[\mu X.F/X], \Gamma}{\vdash \mu X.F, \Gamma} (\mu) & \frac{\vdash G[\nu X.G/X], \Gamma}{\vdash \nu X.G, \Gamma} (\nu) & \frac{F \equiv G}{\vdash F, G^\perp} (\text{Ax}) & \frac{\vdash \Gamma, F \quad \vdash F^\perp, \Delta}{\vdash \Gamma, \Delta} (\text{Cut})
\end{array}$$

■ **Figure 1** Rules of the proof system  $\mu\text{MALL}^\infty$ .

136  $(F \otimes G)^\perp = G^\perp \wp F^\perp$ . We could have designed our system to obtain  $(F \otimes G)^\perp = F^\perp \wp G^\perp$   
 137 instead; this choice is inessential for the present work but makes our definitions suitable, in  
 138 principle, for a treatment of non-commutative logic.

139 ► **Definition 5.** The *Fischer-Ladner closure* of a formula occurrence  $F$ , denoted by  $\text{FL}(F)$ ,  
 140 is the least set of formula occurrences such that  $F \in \text{FL}(F)$  and, whenever  $G \in \text{FL}(F)$ ,  
 141 ■  $G_1, G_2 \in \text{FL}(F)$  if  $G = G_1 \star G_2$  for any  $\star \in \{\oplus, \&, \wp, \otimes\}$ ;  
 142 ■  $B[G/X] \in \text{FL}(F)$  if  $G = \sigma X.B$  for  $\sigma \in \{\nu, \mu\}$ .  
 143 We say that  $G$  is a *sub-occurrence* of  $F$  if  $G \in \text{FL}(F)$ . Note that, for any  $F$  and  $\alpha$ , there  
 144 is at most one  $\varphi$  such that  $\varphi_\alpha$  is a sub-occurrence of  $F$ .

145 We are now ready to introduce our infinitary sequent calculus. Details regarding formula  
 146 occurrences can be ignored at first read, and will only make full sense when one starts  
 147 permuting inferences and eliminating cuts.

148 ► **Definition 6.** A *sequent*, written  $\vdash \Gamma$ , is a finite set of pairwise disjoint, closed formula  
 149 occurrences. A *pre-proof* of  $\mu\text{MALL}^\infty$  is a possibly infinite tree, coinductively generated  
 150 by the rules of Figure 1, subject to the following conditions: any two formulas occurrences  
 151 appearing in different branches must be disjoint except if the branches first differ right after a  
 152  $(\&)$  inference; if  $\varphi_\alpha$  and  $\psi_{\alpha^\perp}$  occur in a pre-proof, they must be the respective sub-occurrences  
 153 of the formula occurrences  $F$  and  $F^\perp$  introduced by a (Cut) rule.

154 The disjointness condition on sequents ensures that two formula occurrences from the  
 155 same sequent will never engender a common sub-occurrence, *i.e.*, we can define traces uniquely.  
 156 The disjointness condition on pre-proofs is there to ensure that the proof transformations  
 157 used in focusing and cut elimination preserve the disjointness condition on sequents. Note  
 158 that these conditions are not restrictive. Clearly, the condition on sequents never prevents  
 159 the (backwards) application of a propositional rule. Moreover, there is an infinite supply of  
 160 disjoint addresses, *e.g.*,  $\{r^n l : n > 0\}$ . One may thus pick addresses from that supply for  
 161 the conclusion sequent of the derivation, and then carry the remaining supply along proof  
 162 branches, splitting it on branching rules, and consuming a new address for cut rules.

163 Pre-proofs are obviously unsound: the pre-proof schema shown  
 164 on the right allows to derive any formula. In order to obtain proper  
 165 proofs from pre-proofs, we will add a validity condition. This  
 166 condition will reflect the nature of our two fixed point connectives.

$$\frac{\frac{\vdots}{\vdash \mu X.X} (\mu) \quad \frac{\vdots}{\vdash \nu X.X, F} (\nu)}{\vdash F} (\text{Cut})$$

167 ► **Definition 7.** Let  $\gamma = (s_i)_{i \in \omega}$  be an infinite branch in a pre-proof of  $\mu\text{MALL}^\infty$ . A *thread*  
 168  $t$  in  $\gamma$  is a sequence of formula occurrences  $(F_i)_{i \in \omega}$  with  $F_i \in s_i$  and  $F_i \sqsubseteq F_{i+1}$ . The set of  
 169 formulas that occur infinitely often in  $(F_i)_{i \in \omega}$  (when forgetting addresses) admits a minimum

170 wrt. the subformula ordering, denoted by  $\min(t)$ . A thread  $t$  is **valid** if  $\min(t)$  is a  $\nu$  formula  
 171 and the thread is not eventually constant, *i.e.*, the formulas  $F_i$  are always eventually principal.

172 ► **Definition 8.** The *proofs* of  $\mu\text{MALL}^\infty$  are those pre-proofs in which every infinite branch  
 173 contains a valid thread.

174 This validity condition has its roots in parity games and is very natural for infinitary  
 175 proof systems with fixed points. It is somehow independent of the ambient logic, and only  
 176 deals with fixed points. It is commonly found in deductive systems for modal  $\mu$ -calculi: see  
 177 [11] for a closely related presentation, which yields a sound and complete sequent calculus  
 178 for linear time  $\mu$ -calculus. The validity conditions of Santocane's circular proofs [22, 13],  
 179 with and without cut, are also instances of the above notion.

180 In the rest of the paper, we work mostly with formula occurrences and will often simply  
 181 call them formulas when it is not ambiguous. As usual in sequent calculus,  $(\text{Ax})$  on a formula  
 182  $F$  can be expanded into axioms on its immediate subformulas. Repeating this process, one  
 183 obtains an axiom-free and valid proof of the original sequent. In fact, this construction yields  
 184 a *regular* derivation tree, the simplest kind of finitely representable infinite derivation.

185 ► **Proposition 9.** Rule  $(\text{Ax})$  is admissible in  $\mu\text{MALL}^\infty$ .

This basic observation, proved in appendix A, justifies that the  $(\text{Ax})$  rule will be ignored  
 in the rest of the paper. In particular, we consider that axioms are expanded away before  
 dealing with cut elimination. Our system  $\mu\text{MALL}^\infty$  is naturally equipped with the cut  
 elimination rules of MALL, extended with the obvious principal and auxiliary rules for fixed  
 point connectives (we do not show symmetric cases):

$$\begin{array}{c}
 \frac{\frac{\vdash \Gamma, F[\mu X.F/X]}{\vdash \Gamma, \mu X.F} (\mu) \quad \frac{\vdash F^\perp[\nu X.F^\perp/X], \Delta}{\vdash \nu X.F^\perp, \Delta} (\nu)}{\vdash \Gamma, \Delta} (\text{Cut}) \quad \frac{\vdash \Gamma, F[\mu X.F/X], G}{\vdash \Gamma, \mu X.F, G} (\mu) \quad \frac{\vdash G^\perp, \Delta}{\vdash G^\perp, \Delta} (\text{Cut})}{\vdash \Gamma, \mu X.F, \Delta} (\text{Cut}) \\
 \downarrow \\
 \frac{\vdash \Gamma, F[\mu X.F/X] \quad \vdash F^\perp[\nu X.F^\perp/X], \Delta}{\vdash \Gamma, \Delta} (\text{Cut}) \quad \frac{\vdash \Gamma, F[\mu X.F/X], G \quad \vdash G^\perp, \Delta}{\vdash \Gamma, F[\mu X.F/X], \Delta} (\text{Cut})}{\vdash \Gamma, \mu X.F, \Delta} (\mu)
 \end{array}$$

186 Natural numbers may be expressed as  $\varphi_{\text{nat}} := \mu X. \mathbf{1} \oplus X$ . Occur-  
 187 rences of that formula will be denoted  $N, N'$ , etc. We give below  
 188 a few examples of proofs/computations on natural numbers, shown  
 189 using two sided sequents for clarity:  $F_1, \dots, F_n \vdash \Gamma$  should be read as  
 190  $\vdash \Gamma, F_1^\perp, \dots, F_n^\perp$  as usual. The proof  $\pi_{\text{succ}}$ , shown on the right, computes the successor on  
 191 natural numbers: if we cut it against a (necessarily finite) cut-free proof of  $N$  we obtain after  
 192 a finite number of cut elimination steps a proof of  $N'$  which is the right injection (rule  $(\mu)$   
 193 followed by  $(\oplus_2)$ , which represents the successor) of the original proof of  $N$ , relocated at the  
 194 address of  $N''$ . Consider now the following pre-proof, called  $\pi_{\text{dup}}$ :

$$\frac{\frac{\overline{\vdash N_1} (\mu), (\oplus_1), (1) \quad \overline{\vdash N_2} (\mu), (\oplus_1), (1)}{\mathbf{1} \vdash N_1 \otimes N_2} (\star) \quad \frac{\overline{N' \vdash N'_1 \otimes N'_2} (\star) \quad \frac{\pi_{\text{succ}} \quad \pi_{\text{succ}}}{N'_1 \otimes N'_2 \vdash N_1 \otimes N_2} (\otimes), (\otimes)}{N' \vdash N_1 \otimes N_2} (\text{Cut})}{N \vdash N_1 \otimes N_2} (\nu), (\&)$$

195 Here,  $(\star)$  represents the cyclic repetition of the same proof, on a structurally equivalent  
 196 sequent (same formulas, new addresses). The resulting pre-proof has exactly one infinite

branch, validated by the thread starting with  $N$ . If we cut that proof against an arbitrary cut-free proof of  $N$ , and perform cut elimination steps, we obtain in finite time a cut-free proof of  $N_1 \otimes N_2$  which consists of two copies (up-to adresses) of the original proof of  $N$ .

Now let  $\varphi_{\text{stream}} = \nu X. \varphi_{\text{nat}} \otimes X$

be the formula representing infinite streams of natural numbers, whose occurrences will be denoted by  $S, S'$ , etc. Let us consider the derivation shown on the right, where  $F$  is an arbitrary, useless formula occurrence for illustrative purposes.

$$\begin{array}{c}
 \frac{\pi_{\text{dup}}}{N \vdash N_1 \otimes N_2} \quad \frac{\frac{N_1 \vdash N' \quad (\text{Ax})}{N_1, N_2, F \vdash N' \otimes S'} \quad \frac{\frac{\pi_{\text{succ}}}{N_2 \vdash N''} \quad \frac{(\star)}{N'', F \vdash S'}}{N_2, F \vdash S'} \quad (\text{Cut})}{N, F \vdash N' \otimes S'} \quad (\text{Cut}) \\
 \frac{N, F \vdash N' \otimes S'}{(\star) \quad N, F \vdash S}
 \end{array}$$

It is a valid proof thanks to the thread on  $S$ . By cut elimination, the computational behaviour of that proof is to take a natural number  $n$ , and some irrelevant  $f$ , and compute the stream  $n :: (n + 1) :: (n + 2) :: \dots$ . However, unlike in the two previous examples, the result of the computation is not obtained in finite time; instead, we are faced with a productive process which will produce any finite prefix of the stream when given enough time. The presence of the useless formula  $F$  illustrates here that weakening may be admissible in  $\mu\text{MALL}^\infty$  under some circumstances, and that cutting against some formulas ( $F$  in this case) will form a redex that will be delayed forever. These subtleties will show up in the next two sections, devoted to showing our two main results.

### 3 Focalization

*Focalization in linear logic.* MALL connectives can be split in two classes: *positive* ( $\otimes, \oplus, \mathbf{0}, \mathbf{1}$ ) and *negative* ( $\wp, \&, \top, \perp$ ) connectives. The distinction can be easily understood in terms of proof search: negative inferences ( $\wp$ ), ( $\&$ ), ( $\top$ ) and ( $\perp$ ) are *reversible* (meaning that provability of the conclusion transfers to the premisses) while positive inferences require choices (splitting the context in ( $\otimes$ ) or choosing between ( $\oplus_1$ ) and ( $\oplus_2$ ) rules) resulting in a possible loss of provability. Still, positive inferences satisfy the **focalization** property [3]: in any provable sequent containing no negative formula, some formula can be chosen as a **focus**, hereditarily selecting its positive subformulas as principal formulas until a negative subformula is reached. It induces the following complete proof search strategy:

Sequent $\Gamma$ <b>contains a negative</b> formula	Sequent $\Gamma$ <b>contains no negative</b> formula
Choose any negative formula (e.g. the leftmost one) and decompose it using the only possible negative rule.	Choose some positive formula and decompose it (and its subformulas) hereditarily until we get to atoms or negative subformulas.

*Focalization graphs.* Focused proofs are complete for proofs, not only provability: any linear proof is equivalent to a focused proof, up to cut-elimination. Indeed, focalization can be proved by means of proof transformations [18, 20, 6] preserving the denotation of the proof. A flexible, modular method for proving focalization that we shall apply in the next sections has been introduced by Miller and the third author [20] and relies on **focalization graphs**. The heart of the focalization graph proof technique relies on the fact the positive inference, while not reversible, all permute with each other. As a consequence, if the positive layer of some positive formula is completely decomposed within the lowest part of the proof, below any negative inference, then it can be taken as a focus. Focalization graphs ensure that it is always possible: their acyclicity provides a source which can be taken as a focus.

*Focusing infinitary proofs.* The infinitary nature of our proofs interferes with focalization in several ways. First, while in  $\mu\text{MALL}$   $\mu$  and  $\nu$  can be set to have an arbitrary polarity, we will see that in  $\mu\text{MALL}^\infty$ ,  $\nu$  must be negative. Second, permutation properties of the negative inferences, which can be treated locally in  $\mu\text{MALL}$ , now require a global treatment due to infinite branches. Last, focalization graphs strongly rely on the finiteness of maximal positive subtrees of a proof: this invariant must be preserved in  $\mu\text{MALL}^\infty$ .

For simplicity reasons, we restrict our attention to cut-free proofs in the rest of this section. The result holds for proofs with cuts thanks to the usual trick of viewing cuts as  $\otimes$ .

### 3.1 Polarity of connectives

Let us first consider the question of polarizing  $\mu\text{MALL}^\infty$  connectives. Unlike in  $\mu\text{MALL}$ , we are not free to set the polarity of fixed points formulas: consider the proof  $\pi$  of sequent  $\vdash \mu X.X, \nu Y.Y$  which alternates inferences  $(\nu)$  and  $(\mu)$ . Assigning opposite polarities to dual formulas (an invariant necessary to define properly cut-elimination in focused proof systems), this sequent contains a negative formula; each polarization of fixed points induces one focused pre-proof, either  $\pi_\mu$  which always unrolls  $\mu$  or  $\pi_\nu$  which repeatedly unrolls  $\nu$ . Only  $\pi_\nu$  happens to be valid, leaving but one possible choice,  $\nu X.F$  negative and  $\mu X.F$  positive, resulting in the following polarization:

► **Definition 10. Negative formulas** are formulas of the form  $\nu X.F$ ,  $F \wp G$ ,  $F \& G$ ,  $\perp$  and  $\top$ , **positive formulas** are formulas of the form  $\mu X.F$ ,  $F \otimes G$ ,  $F \oplus G$ ,  $\mathbf{1}$  and  $\mathbf{0}$ . A  $\mu\text{MALL}^\infty$  sequent containing only positive formulas is said to be **positive**. Otherwise, it is **negative**.

The following proposition will be useful in the following:

► **Proposition 11.** *An infinite branch of a pre-proof containing only negative (resp. positive) rules is always valid (resp. invalid).*

### 3.2 Reversibility of negative inferences

The following example with  $F = \nu X.(X \& X) \oplus \mathbf{0}$  shows that, unlike in (MA)LL, negative inferences cannot be permuted down locally: no occurrence of a negative inference  $(\wp)$  on  $P \wp Q$  can be permuted below a  $(\&)$  since it is never available in the left premise. We thus introduce a global proof transformation (which could be realized by means of cut, as is usual).

$$\frac{\frac{(\star)}{\vdash F, P \wp Q} \quad \frac{\pi}{\vdash F, P, Q} (\wp)}{\vdash F, P \wp Q} (\&) \quad \frac{\vdash F \& F, P \wp Q}{\vdash (F \& F) \oplus \mathbf{0}, P \wp Q} (\oplus_1) \quad \frac{\vdash (F \& F) \oplus \mathbf{0}, P \wp Q}{(\star) \vdash F, P \wp Q} (\nu)$$

Negative rules have a uniform structure:  $\frac{(\vdash \Gamma, \mathcal{N}_i^N)_{1 \leq i \leq n}}{\vdash \Gamma, N} (r_N)$ . **Sub-occurrence families** of  $N$  are thus defined as  $\mathcal{N}(N) = (\mathcal{N}_i^N)_{1 \leq i \leq n}$ , its **slicing index** being  $\text{sl}(N) = \#\mathcal{N}(N)$ .

$N$	$F_1 \wp F_2$	$\perp$	$F_1 \& F_2$	$\top$	$\nu X.F$
$\mathcal{N}(N)$	$\{1 \mapsto \{F_1, F_2\}\}$	$\{1 \mapsto \emptyset\}$	$\{1 \mapsto \{F_1\}, 2 \mapsto \{F_2\}\}$	$\emptyset$	$\{1 \mapsto \{F[\nu X.F/X]\}\}$

The following two definitions define what the reversibility of a proof  $\pi$ ,  $\text{rev}(\pi)$ , is:

► **Definition 12** ( $\pi(i, N)$ ). Let  $\pi$  be a proof of  $\vdash \Gamma$  of last rule  $(r)$  and premises  $\pi_1, \dots, \pi_n$ . If  $1 \leq i \leq \text{sl}(N)$ , we define  $\pi(i, N)$  coinductively:

- if  $N$  does not occur in  $\vdash \Gamma$ ,  $\pi(i, N) = \pi$ ;
- if  $r$  is the inference on  $N$ , then  $\pi(i, N) = \pi_i$ ; (which is legal since in this case  $n = \text{sl}(N)$ );
- if  $r$  is not the inference on  $N$ , then  $\pi(i, N) = \frac{\pi_1(i, N) \quad \dots \quad \pi_n(i, N)}{\vdash \Gamma, \mathcal{N}_i^N} (r)$ .

274 ► **Definition 13** ( $\text{rev}(\pi)$ ). Let  $\pi$  be a  $\mu\text{MALL}^\infty$  proof of  $\vdash \Gamma$ .  $\text{rev}(\pi)$  is a pre-proof non-  
 275 deterministically defined as  $\pi$  if  $\vdash \Gamma$  is positive and, otherwise, when  $N \in \Gamma$  and  $n = \text{sl}(N)$ ,  
 276 as  $\text{rev}(\pi) = \frac{\text{rev}(\pi(1, N)) \quad \dots \quad \text{rev}(\pi(n, N))}{\vdash \Gamma} \text{ (r}_N\text{)}$ .

277 Reversed proofs formalize the requirement for the whole  
 278 negative layer to be reversed:

279 ► **Definition 14. Reversed pre-proofs** are defined to be  
 280 the largest set of pre-proofs such that: (i) every pre-proof of  
 281 a positive sequent is reversed; (ii) a pre-proof of a negative  
 282 sequent is reversed if it ends with a negative inference and  
 283 if each of its premises is reversed.

284 ► **Example 15.**  $\text{rev}$  is illustrated on the proof starting this  
 285 subsection ( $N = P \wp Q$ ,  $\text{sl}(N) = 1$ ) in Figure 2

286 ► **Theorem 16.** Let  $\pi$  be a  $\mu\text{MALL}^\infty$  proof.  $\text{rev}(\pi)$  is a  
 287 reversed proof of the same sequent.

$$\begin{aligned} \text{rev}(\pi) &= \frac{\pi(1, N)}{\vdash F, P \wp Q} \text{ (}\wp\text{)} \\ &\stackrel{(\star)}{=} \frac{\frac{\vdash F, P, Q}{\vdash F \& F, P, Q} \quad \frac{\pi}{\vdash F, P, Q}}{\vdash (F \& F) \oplus 0, P, Q} \text{ (}\&\text{)} \\ &\stackrel{(\oplus 1)}{=} \frac{\vdash (F \& F) \oplus 0, P, Q}{(\star) \vdash F, P, Q} \text{ (}\nu\text{)} \\ &\stackrel{(\wp)}{=} \frac{(\star) \vdash F, P, Q}{\vdash F, P \wp Q} \text{ (}\wp\text{)} \end{aligned}$$

Figure 2  $\text{rev}(\pi)$

### 3.3 Focalization Graph

289 In this section, we adapt the focalization graphs introduced  
 290 in [20] to our setting. Considering the permutability prop-  
 291 erties of positive inferences in  $\mu\text{MALL}^\infty$ , finiteness of positive trunks and acyclicity of  
 292 focalization graphs will be sufficient to make the proof technique of [20] applicable. In order  
 293 to illustrate this subsection, an example is fully explained in appendix B.5

294 ► **Definition 17** (Positive trunk, positive border, active formulas). Let  $\pi$  be a  $\mu\text{MALL}^\infty$  proof  
 295 of  $\mathcal{S}$ . The **positive trunk**  $\pi^+$  of  $\pi$  is the tree obtained by cutting (finite or infinite) branches  
 296 of  $\pi$  at the first occurrence of a negative rule. The **positive border** of  $\pi$  is the collection  
 297 of lowest sequents in  $\pi$  which are conclusions of negative rules. **P-active** formulas of  $\pi$  are  
 298 those formulas of  $\mathcal{S}$  which are principal formulas of an inference in  $\pi^+$ .

299 ► **Proposition 18.** The positive trunk of a  $\mu\text{MALL}^\infty$  proof is always finite.

300 ► **Definition 19** (Focalization graph). Given a  $\mu\text{MALL}^\infty$  proof  $\pi$ , we define its **focalization**  
 301 **graph**  $\mathcal{G}(\pi)$  to be the graph whose vertices are the P-active formulas of  $\pi$  and such that  
 302 there is an edge from  $F$  to  $G$  iff there is a sequent  $\mathcal{S}'$  in the positive border containing a  
 303 negative sub-occurrence  $F'$  of  $F$  and a positive sub-occurrence  $G'$  of  $G$ .

304  $\mu\text{MALL}^\infty$  positive inferences are those of  $\text{MALL}$  extended with  $(\mu)$  which is not branching;  
 305 this ensures both that any two positive inferences permute and that the proof of acyclicity of  
 306  $\text{MALL}$  focalization graphs can easily be adapted, from which we conclude that:

307 ► **Proposition 20.** Focalization graphs are acyclic.

308 Acyclicity of the focalization graph implies in particular that it has a source, that is a  
 309 formula  $P$  of the conclusion sequent such that whenever one of its subformulas  $F$  appears in  
 310 a border sequent,  $F$  is negative. This remark, together with the fact that the trunk is finite  
 311 ensures that the positive layer of  $P$  is completely decomposed in the positive trunk.

312 ► **Definition 21** ( $\text{foc}(\pi, P)$ ). Let  $\pi$  be a  $\mu\text{MALL}^\infty$  proof of  $\vdash \Gamma, P$  with  $P$  a source of  $\pi$ 's  
 313 focalization graph. One defines  $\text{foc}(\pi, P)$  as the  $\mu\text{MALL}^\infty$  proof obtained by permuting down  
 314 all the positive inferences on  $P$  and its positive subformulas (all occurring in  $\pi^+$ ).

315 ► **Proposition 22.** *Let  $\mathcal{S}$  be a lowest sequent of  $\text{foc}(\pi, P)$  which is not conclusion of a rule on*  
 316 *a positive subformula of  $P$ . Then  $\mathcal{S}$  contains exactly one subformula of  $P$ , which is negative.*

### 317 3.4 Productivity and validity of the focalization process

318 Reversibility of the negative inferences and focalization of the positive inferences allow to  
 319 consider the following (non-deterministic) proof transformation process:

320 **Focalization Process:** Let  $\pi$  be a  $\mu\text{MALL}^\infty$  proof of  $\mathcal{S}$ . Define  $\text{Foc}(\pi)$  as follows:  
 321 ■ **Asynchronous phase:** If  $\mathcal{S}$  is negative, transform  $\pi$  into  $\text{rev}(\pi)$  which is reversed. At  
 322 least one negative inference has been brought to the root of the proof. Apply (corecursively)  
 323 the synchronous phase to the proofs rooted in the lowest positive sequents of  $\text{rev}(\pi)$ .  
 324 ■ **Synchronous phase:** If  $\mathcal{S}$  is positive, let  $P \in \mathcal{S}$  be a source of the associated focalization  
 325 graph. Transform  $\pi$  into a proof  $\text{foc}(\pi, P)$ . At least one positive inference on  $P$  has been  
 326 brought to the root of the proof. Apply (corecursively) the asynchronous phase to the  
 327 proofs rooted in the lowest negative sequents of  $\text{foc}(\pi, P)$ .

328 Each of the above phases produces one non-empty phase, the above process is thus  
 329 productive. It is actually a pre-proof thanks to theorem 16 and by definition of  $\text{foc}(\pi, P)$ . It  
 330 remains to show that the resulting pre-proof is actually a proof. The following property is  
 331 easily seen to be preserved by both transformations  $\text{foc}$  and  $\text{rev}$  and thus holds for  $\text{Foc}(\pi)$ :

332 ► **Proposition 23.** *Let  $\pi$  be a  $\mu\text{MALL}^\infty$  proof,  $r$  a positive rule occurring in  $\pi$  and  $r'$  be a*  
 333 *negative rule occurring below  $r$  in  $\pi$ . If  $r$  occurs in  $\text{Foc}(\pi)$ , then  $r'$  occurs in  $\text{Foc}(\pi)$ , below  $r$ .*

334 ► **Lemma 24.** *For any infinite branch  $\gamma$  of  $\text{Foc}(\pi)$  containing an infinite number of positive*  
 335 *rules, there exists an infinite branch in  $\pi$  containing infinitely many positive rules of  $\gamma$ .*

336 ► **Theorem 25.** *If  $\pi$  is a  $\mu\text{MALL}^\infty$  proof then  $\text{Foc}(\pi)$  is also a  $\mu\text{MALL}^\infty$  proof.*

337 **Proof sketch, see appendix.** An infinite branch  $\gamma$  of  $\text{Foc}(\pi)$  may either be obtained by  
 338 reversibility only after a certain point, or by alternating infinitely often synchronous and  
 339 asynchronous phases. In the first case it is valid by proposition 11 while in the latter case,  
 340 lemma 24 ensures the existence of a branch  $\delta$  of  $\pi$  containing infinitely many positive rules  
 341 of  $\gamma$ , with a valid thread  $t$  of minimal formula  $F_m$ : every rule  $r$  of  $\delta$  in which  $F_m$  is principal  
 342 is below a positive rule occurring in  $\gamma$ . Thus  $r$  occurs in  $\gamma$ , which is therefore valid. ◀

## 343 4 Cut elimination

344 In this section, we show that any  $\mu\text{MALL}^\infty$  proof can be transformed into an equivalent  
 345 cut-free derivation. This is done by applying the cut reduction rules described in Section 2,  
 346 possibly in infinite reductions converging to cut-free proofs. As usual with infinitary reductions  
 347 it is not the case that any reduction sequence converges: for instance, one could reduce  
 348 only deep cuts in a proof, leaving a cut untouched at the root. We avoid this problem by  
 349 considering a form of head reduction where we only reduce cuts at the root.

350 Cut reduction rules are of two kinds, *principal* reductions and *auxiliary* ones. In the  
 351 infinitary setting, principal cut reductions do not immediately contribute to producing a  
 352 cut-free pre-proof. On the contrary, auxiliary cut reductions are productive in that sense. In  
 353 other words, principal rules are seen as internal computations of the cut elimination process,  
 354 while auxiliary rules are seen as a partial output of that process. Accordingly, the former  
 355 will be called *internal rules* and the latter *external rules*.

$$\begin{array}{c}
\frac{\frac{\vdash \Gamma, F \quad \vdash F^\perp, \Delta}{\vdash \Gamma, \Delta} \text{ (Cut)} \quad \dots}{\vdash \Sigma} \text{ (mcut)} \quad \longrightarrow \quad \frac{\vdash \Gamma, F \quad \vdash F^\perp, \Delta \quad \dots}{\vdash \Sigma} \text{ (mcut)} \\
\\
\frac{\frac{\vdash \Gamma, F}{\vdash \Gamma, F \oplus G} \quad \frac{\vdash G^\perp, \Delta \quad \vdash F^\perp, \Delta}{\vdash G^\perp \& F^\perp, \Delta} \quad \dots}{\vdash \Sigma} \text{ (mcut)} \quad \longrightarrow \quad \frac{\vdash \Gamma, F \quad \vdash F^\perp, \Delta \quad \dots}{\vdash \Sigma} \text{ (mcut)} \\
\\
\frac{s_1 \dots s_n \quad \frac{\vdash \Gamma, F \quad \vdash \Gamma, G}{\vdash \Gamma, F \& G} \text{ (\&)} \quad \frac{s_1 \dots s_n \quad \vdash \Gamma, F}{\vdash \Sigma, F} \text{ (mcut)} \quad \frac{s_1 \dots s_n \quad \vdash \Gamma, G}{\vdash \Sigma, G} \text{ (mcut)}}{\vdash \Sigma, F \& G} \text{ (mcut)} \quad \longrightarrow \quad \frac{\frac{s_1 \dots s_n \quad \vdash \Gamma, F}{\vdash \Sigma, F} \text{ (mcut)} \quad \frac{s_1 \dots s_n \quad \vdash \Gamma, G}{\vdash \Sigma, G} \text{ (mcut)}}{\vdash \Sigma, F \& G} \text{ (\&)}
\end{array}$$

■ **Figure 3** (Cut)/(mcut) and ( $\oplus$ )/(&) internal reductions and (&)/(mcut) external reduction.

When analyzing cut reductions, cut commutations can be troublesome. A common way to avoid this technicality [13], which we shall follow, is to introduce a **multicut** rule which merges multiple cuts, avoiding cut commutations.

► **Definition 26.** Given two sequents  $s$  and  $s'$ , we say that they are cut-connected on a formula occurrence  $F$  when  $F \in s$  and  $F^\perp \in s'$ . We say that they are cut-connected when they are connected for some  $F$ . We define the **multicut** rule as shown above with conclusion  $s$  and premisses  $\{s_i\}_i$ , where the set  $\{s_i\}_i$  is connected and acyclic with respect to the cut-connection relation, and  $s$  is the set of all formula occurrences  $F$  that appear in some  $s_i$  but such that no  $s_j$  is cut-connected to  $s_j$  on  $F$ .

From now on we shall work with  $\mu\text{MALL}_m^\infty$  derivations, which are  $\mu\text{MALL}^\infty$  derivations in which the multicut rule may occur, though only at most once per branch. The notions of thread and validity are unchanged. In  $\mu\text{MALL}_m^\infty$  we only reduce multicuts, in a way that is naturally obtained from the cut reductions of  $\mu\text{MALL}^\infty$ . A complete description of the rules is given in Definition 49, appendix C.1; only the (Cut)/(mcut) and ( $\oplus$ )/(&) internal reduction cases and the (&)/(mcut) external reduction case are shown in figure 3. As is visible in the last reduction, applying an external rule on a multicut may yield multiple multicuts, though always on disjoint subtrees.

We will be interested in a particular kind of multicut reduction sequences, the **fair** ones, which are such that any redex which is available at some point of the sequence will eventually have disappeared from the sequence (being reduced or erased), details are provided in appendix C.1. We will establish that these reductions eliminate multicuts:

► **Theorem 27.** *Fair multicut reductions on  $\mu\text{MALL}_m^\infty$  proofs produce  $\mu\text{MALL}^\infty$  proofs.*

Additionally, if all cuts in the initial derivation are above multicuts, the resulting  $\mu\text{MALL}^\infty$  derivation must actually be cut-free: indeed, multicut reductions never produce a cut. Thus Theorem 27 gives a way to eliminate cuts from any  $\mu\text{MALL}^\infty$  proof  $\pi$  of  $\vdash \Gamma$  by forming a multicut with conclusion  $\vdash \Gamma$  and  $\pi$  as unique subderivation, and eliminating multicuts (and cuts) from that  $\mu\text{MALL}_m^\infty$  proof. The proof of Theorem 27 is in two parts. We first prove that fair internal multicut reductions cannot diverge (Proposition 37), hence fair multicut reductions are productive, *i.e.*, reductions of  $\mu\text{MALL}_m^\infty$  proofs converge to  $\mu\text{MALL}^\infty$  pre-proofs. We then establish that the obtained pre-proof is a valid proof (Proposition 38).

Regarding productivity, assuming that there exists an infinite sequence  $\sigma$  of internal cut-reductions from a given proof  $\pi$  of  $\Gamma$ , we obtain a contradiction by extracting from  $\pi$  a

proof of the empty sequent in a suitably defined proof-system. More specifically, we observe that no formula of  $\Gamma$  is principal in the subtree  $\pi_\sigma$  of  $\pi$  visited by  $\sigma$ . Hence, by erasing every formula of  $\Gamma$  from  $\pi_\sigma$ , local correctness of the proof is preserved, resulting in a tree deriving the empty sequent. This tree can be viewed as a proof in a new proof-system  $\mu\text{MALL}_\tau^\infty$  which is shown to be sound (Proposition 34) with respect to the traditional boolean semantics of the  $\mu$ -calculus, thus the contradiction. The proof of validity of the produced pre-proof is similar: instead of extracting a proof of the empty sequent from  $\pi$  we will extract, for each invalid branch of  $\pi$ , a  $\mu\text{MALL}_\tau^\infty$  proof of a formula containing neither  $\mathbf{1}$ ,  $\top$ , nor  $\nu$  formulas, contradicting soundness again.

#### 4.1 Extracting proofs from reduction paths

We define now a key notion to analyze the behaviour of multicut-elimination: given a multicut reduction starting from  $\pi$ , we extract a (slightly modified) subderivation of  $\pi$  which corresponds to the part of the derivation that has been explored by the reduction. More precisely, we are interested in *reduction paths* which are sequences of proofs that end with a multicut rule, obtained by tracing one multicut through its evolution, selecting only one sibling in the case of  $(\&)$  and  $(\otimes)$  external reductions. Given such a reduction path starting with  $\pi$ , we consider the subtree of  $\pi$  whose sequents occur in the reduction path as premises of some multicut. This subtree is obviously not always a  $\mu\text{MALL}^\infty$  derivation since some of its nodes may have missing premises. We will provide an extension of  $\mu\text{MALL}^\infty$  where these trees can be viewed as proper derivations by first characterizing when this situation arises.

► **Definition 28** (Useless sequents, distinguished formula). Let  $\mathcal{R}$  be a reduction path starting with  $\pi$ . A sequent  $s = (\vdash \Gamma, F)$  of  $\pi$  is said to be *useless* with *distinguished formula*  $F$  when in one of the following cases:

1. The sequent eventually occurs as a premise of all multicut of  $\mathcal{R}$  and  $F$  is the principal formula of  $s$  in  $\pi$ . (Note that the distinguished formula  $F$  of a useless sequent  $s$  of sort (1) must be a sub-occurrence of a cut formula in  $\pi$ . Otherwise, the fair reduction path  $\mathcal{R}$  would eventually have applied an external rule on  $s$ . Moreover,  $F^\perp$  never becomes principal in the reduction path, otherwise by fairness the internal rule reducing  $F$  and  $F^\perp$  would have been applied.)
2. At some point in the reduction, the sequent is a premise of  $(\&)$  on  $F \& F'$  or  $F' \& F$  which is erased in an internal  $(\&)/(\oplus)$  multicut reduction. (In the  $(\oplus_1)/(\&)$  internal reduction of figure 3, the sequent  $\vdash G^\perp, \Delta$  is useless of sort (2).)
3. The sequent is ignored at some point in the reduction path because it is not present in the selected multicut after a branching external reduction on  $F \star F'$  or  $F' \star F$ , for  $\star \in \{\otimes, \&\}$ . (In the  $(\&)/(\text{mcut})$  external reduction of figure 3, if one is considering a reduction path that follows the multicut having  $\vdash \Gamma, F$  as a premise, then the sequent  $\vdash \Gamma, G$  is useless of sort (3), and vice versa.)
4. The sequent is ignored at some point in the reduction path because a  $(\otimes)/(\text{mcut})$  external reduction distributes  $s$  to the multicut that is not selected in the path. This case will be illustrated next, and is described in full details in appendix C.1.

Note that, although the external reduction for  $\top$  erases sequents, we do not need to consider such sequents as useless: indeed, we will only need to work with useless sequents in infinite reduction paths, and the external reduction associated to  $\top$  terminates a path.

► **Example.** Consider a multicut composed of the last example of Section 2 and an arbitrary proof of  $\vdash F, \Delta$  where  $F$  is principal. In the reduction paths which always select the right

premise of an external  $(\otimes)/(\text{mcut})$  corresponding to the  $N' \otimes S'$  formulas, the sequent  $\vdash F, \Delta$  will always be present and thus useless by case (1). In the reduction paths which eventually select a left premise, the sequent  $N_2, F \vdash S'$  is useless of sort (3) with  $S'$  distinguished, and  $\vdash F, \Delta$  is useless of sort (4) with  $F$  distinguished.

In order to obtain a proper pre-proof from the sequents occurring in a reduction path, we need to close the derivation on useless sequents. This is done by replacing distinguished formulas by  $\top$  formulas. However, a usual substitution is not appropriate here as we are really replacing formula occurrence, which may be distributed in arbitrarily complex ways among sub-occurrences.

► **Definition 29.** A *truncation*  $\tau$  is a partial function from  $\Sigma^*$  to  $\{\top, \mathbf{0}\}$  such that:

- For any  $\alpha \in \Sigma^*$ , if  $\alpha \in \text{Dom}(\tau)$ , then  $\alpha^\perp \in \text{Dom}(\tau)$  and  $\tau(\alpha) = \tau(\alpha^\perp)^\perp$ .
- If  $\alpha \in \text{Dom}(\tau)$  then for any  $\beta \in \Sigma^+$ ,  $\alpha.\beta \notin \text{Dom}(\tau)$ .

► **Definition 30** (Truncation of a reduction path). Let  $\mathcal{R}$  be a reduction path. The truncation  $\tau$  associated to  $\mathcal{R}$  is defined by setting  $\tau(\alpha) = \top$  and  $\tau(\alpha^\perp) = \mathbf{0}$  for every formula occurrence  $\varphi_\alpha$  that is distinguished in some useless sequent of  $\mathcal{R}$ .

The above definition is justified because  $F$  and  $F^\perp$  cannot both be distinguished, by fairness of  $\mathcal{R}$ . We can finally obtain the pre-proof associated to a reduction path, in a proof system slightly modified to take truncations into account.

► **Definition 31** (Truncated proof system). Given a truncation  $\tau$ , the infinitary proof system  $\mu\text{MALL}_\tau^\infty$  is obtained by taking all the rules of  $\mu\text{MALL}^\infty$ , with the proviso that they only apply when the address of their principal formula is not in the domain of  $\tau$ , with the following extra rule:

$$\frac{\vdash \tau(\alpha)_{\alpha i}, \Delta}{\vdash F, \Delta} (\tau) \quad \text{if } \alpha \in \text{Dom}(\tau)$$

The adress  $\alpha.i$  associated with  $\tau(\alpha)$  in the rule  $(\tau)$  forbids loops on a  $(\tau)$  rule. Indeed if  $\alpha \in \text{Dom}(\tau)$  then  $\alpha.i \notin \text{Dom}(\tau)$ .

► **Definition 32** (Truncated proof associated to a reduction path). Let  $\mathcal{R}$  be a fair infinite reduction path starting with  $\pi$  and  $\tau$  be the truncation associated to it. We define  $TR(\mathcal{R})$  to be the  $\mu\text{MALL}_\tau^\infty$  proof obtained from  $\pi$  by keeping only sequents that occur as premise of some multicut in  $\mathcal{R}$ , using the same rules as in  $\pi$  whenever possible, and deriving useless sequents by rules  $(\tau)$  and  $(\top)$ .

This definition is justified by definition of  $\tau$  and because only useless sequents may be selected without their premises (in  $\pi$ ) being also selected. Notice that the dual  $F^\perp$  of a distinguished formula  $F$  may only occur in  $\mathcal{R}$  for distinguished formulas of type (1) and (4); in these cases  $F^\perp$  is never principal in  $\mathcal{R}$  by fairness. Thus, there is no difficulty in constructing  $TR(\mathcal{R})$  with a truncature defined on the address of  $F^\perp$ . Finally, note that  $TR(\mathcal{R})$  is indeed a valid  $\mu\text{MALL}_\tau^\infty$  pre-proof, because its infinite branches are infinite branches of  $\pi$ .

► **Example.** Continuing the previous example, we consider the path where the left premise of the tensor is selected immediately. The associated truncation is such that  $\tau(S') = \top$  and  $\tau(F) = \top$  by (3) and (4) respectively. The derivation  $TR(\mathcal{R})$  is shown below, where  $\Pi_{\text{ax}}$  denotes the expansion of the axiom given by Prop 9.

$$\frac{\frac{\frac{\Pi_{\text{ax}}}{N_1 \vdash N'} \quad \frac{}{N_2, F \vdash S'}{N_1, N_2, F \vdash N' \otimes S'} (\tau), (\top)}{\frac{\Pi_{\text{dup}}}{N \vdash N_1 \otimes N_2} \quad \frac{}{N_1 \otimes N_2, F \vdash N' \otimes S'} (\text{Cut})}{\frac{}{N, F \vdash N' \otimes S'} (\tau), (\top)} \quad \frac{}{N, F \vdash S} (\text{mcut})}{N \vdash S, \Delta}$$

## 4.2 Truncated truth semantics

We fix a truncation  $\tau$  and define a truth semantics with respect to which  $\mu\text{MALL}_\tau^\infty$  will be sound. The semantics is classical, assigning a boolean value to formula occurrences. For convenience, we take  $\mathcal{B} = \{\mathbf{0}, \top\}$  as our boolean lattice, with  $\wedge$  and  $\vee$  being the usual meet and join operations on it. The following definition provides an interpretation of  $\mu\text{MALL}$  formulas which consists in the composition of the standard interpretation of  $\mu$ -calculus formulas with the obvious linearity-forgetting translation from  $\mu\text{MALL}$  to classical  $\mu$ -calculus.

► **Definition 33.** Let  $\varphi_\alpha$  be a pre-formula occurrence. We call *environment* any function  $\mathcal{E}$  mapping free variables of  $\varphi$  to (total) functions of  $E := \Sigma^* \rightarrow \mathcal{B}$ . We define  $[\varphi_\alpha]^\mathcal{E} \in \mathcal{B}$ , the *interpretation* of  $\varphi_\alpha$  in the environment  $\mathcal{E}$ , by  $[\varphi_\alpha]^\mathcal{E} = \tau(\alpha)$  if  $\alpha \in \text{Dom}(\tau)$ , and otherwise:

- $[X_\alpha]^\mathcal{E} = \mathcal{E}(X)(\alpha)$ ,  $[\top_\alpha]^\mathcal{E} = [\mathbf{1}_\alpha]^\mathcal{E} = \top$  and  $[\mathbf{0}_\alpha]^\mathcal{E} = [\perp_\alpha]^\mathcal{E} = \mathbf{0}$ .
- $[(\varphi \otimes \psi)_\alpha]^\mathcal{E} = [\varphi_{\alpha.l}]^\mathcal{E} \wedge [\psi_{\alpha.r}]^\mathcal{E}$ , for  $\otimes \in \{\&, \otimes\}$ .
- $[(\varphi \oplus \psi)_\alpha]^\mathcal{E} = [\varphi_{\alpha.l}]^\mathcal{E} \vee [\psi_{\alpha.r}]^\mathcal{E}$ , for  $\oplus \in \{\oplus, \wp\}$ .
- $[(\mu X.\varphi)_\alpha]^\mathcal{E} = \text{lfp}(f)(\alpha)$  and  $[(\nu X.\varphi)_\alpha]^\mathcal{E} = \text{gfp}(f)(\alpha)$  where  $f : E \rightarrow E$  is given by  $f : h \mapsto \beta \mapsto (\tau(\beta) \text{ if } \beta \in \text{Dom}(\tau) \text{ and } [\varphi_{\beta.i}]^{\mathcal{E}::X \mapsto h} \text{ otherwise})$ .

When  $F$  is closed, we simply write  $[F]$  for  $[F]^\emptyset$ .

We refer the reader to the appendix for details on the construction of the interpretation. We simply state here the main result about it.

► **Proposition 34.** If  $\vdash \Gamma$  is provable in  $\mu\text{MALL}_\tau^\infty$ , then  $[F] = \top$  for some  $F \in \Gamma$ .

We only sketch the soundness proof (see appendix C for details) which proceeds by contradiction. Assuming we are given a proof  $\pi$  of a formula  $F$  such that  $[F] = \mathbf{0}$ , we exhibit a branch  $\beta$  of  $\pi$  containing only formulas interpreted by  $\mathbf{0}$ . A validating thread of  $\beta$  unfolds infinitely often some formula  $\nu X.\varphi$ . Since the interpretation of  $\nu X.\varphi$  is defined as the gfp of a monotonic operator  $f$  we have, for each occurrence  $(\nu X.\varphi)_\alpha$  in  $\beta$ , an ordinal  $\lambda$  such that  $[(\nu X.\varphi)_\alpha] = f^\lambda(\bigvee E)(\alpha)$ , where  $\bigvee E$  is the supremum of the complete lattice  $E$ . We show that this ordinal can be forced to decrease along  $\beta$  at each fixed point unfolding, contradicting the well-foundedness of the class of ordinals.

► **Definition 35.** A truncation  $\tau$  is *compatible* with a formula  $\varphi_\alpha$  if  $\alpha \notin \text{dom}(\tau)$  and, for any  $\alpha \sqsubseteq \beta.d \in \text{Dom}(\tau)$  where  $d \in \{l, r, i\}$ , we have that  $\varphi_\alpha$  admits a sub-occurrence  $\psi_\beta$  with  $\otimes$  or  $\&$  as the toplevel connective of  $\psi$ ,  $d \in \{l, r\}$ , and  $\alpha.d' \notin \text{Dom}(\tau)$  for any  $d' \neq d$ .

In other words, a truncation  $\tau$  is compatible with a formula  $F$  if it truncates only sons of  $\otimes$  or  $\&$  nodes in the tree of the formula  $F$  and at most one son of each such node.

► **Proposition 36.** If  $F$  is a formula compatible with  $\tau$  and containing no  $\nu$  binders, no  $\top$  and no  $\mathbf{1}$ , then  $[F] = \mathbf{0}$ .

## 4.3 Proof of cut elimination

Multicut reduction is shown productive and then to result in a valid cut-free proof.

► **Proposition 37.** Any fair reduction sequence produces a  $\mu\text{MALL}_\tau^\infty$  pre-proof.

**Proof.** By contradiction, consider a fair infinite sequence of internal multicut reductions. This sequence is a fair reduction path  $\mathcal{R}$ . Let  $\tau$  and  $TR(\mathcal{R})$  be the associated truncations and truncated proof. Since no external reduction occurs, it means that conclusion formulas of  $TR(\mathcal{R})$  are never principal in the proof, thus we can transform it into a proof of the empty sequent, which contradicts soundness of  $\mu\text{MALL}_\tau^\infty$ . ◀

► **Proposition 38.** *Any fair mcut-reduction produces a  $\mu\text{MALL}^\infty$  proof.*

**Proof.** Let  $\pi$  be a  $\mu\text{MALL}_m^\infty$  proof of conclusion  $\vdash \Gamma$ , and  $\pi'$  the cut-free pre-proof obtained by Prop. 37, *i.e.*, the limit of the multicut reduction process. Any branch of  $\pi'$  corresponds to a multicut reduction path. For the sake of contradiction, assume that  $\pi'$  is invalid. It must thus have an invalid infinite branch, corresponding to an infinite reduction path  $\mathcal{R}$ . Let  $\tau$  and  $\theta := TR(\mathcal{R})$  be the associated truncation and truncated proof in  $\mu\text{MALL}_\tau^\infty$ .

We first observe that formulas of  $\Gamma$  cannot have suboccurrences of the form  $\mathbf{1}_\alpha$  or  $\top_\alpha$  that are principal in  $\pi'$ . Indeed, this could only be produced by an external rule  $(\top)/(\text{mcut})$  in the reduction path  $\mathcal{R}$ , but that would terminate the path, contradicting its infiniteness.

Next, we claim that all threads starting from formulas in  $\Gamma$  are invalid. Indeed, all rules applied to those formulas are transferred (by means of external rules) to the branch produced by the reduction path. The existence of a valid thread starting from the conclusion sequent in  $\theta$  would thus imply the existence of a valid thread in our branch of  $\pi'$ .

By the first observation, we can replace all  $\mathbf{1}$  and  $\top$  subformulas of  $\Gamma$  by  $\mathbf{0}$  without changing the derivation, and obviously without breaking its validity. By the second observation, we can further modify  $\Gamma$  by changing all  $\nu$  combinators into  $\mu$  combinators. The derivation is easily adapted (using rule  $(\mu)$  instead of  $(\nu)$ ) and it remains valid, since the validity of  $\theta$  could not have been caused by a valid thread starting from the root. We thus obtain a valid pre-proof  $\theta'$  of  $\vdash \Gamma'$  in  $\mu\text{MALL}_\tau^\infty$ , where  $\Gamma'$  contains no  $\nu$ ,  $\mathbf{1}$  and  $\top$ .

We finally show that  $\tau$  is compatible with any formula occurrence from  $\Gamma$ . Indeed, if  $\tau(\beta)$  is defined for some suboccurrence  $\psi_\beta$  of a formula  $\varphi_\alpha \in \Gamma$ , then it can only be because of a useless sequent of sort (3), *i.e.*, a truncation due to the fact that the reduction path has selected only one sibling after a branching external rule. We thus conclude, by Proposition 36, that all formulas of  $\Gamma$  are interpreted as  $\mathbf{0}$  in the truncated semantics associated to  $\tau$ , which contradicts the validity of  $\theta'$  and Proposition 34. ◀

## 5 Conclusion

We have established focalization and cut elimination for  $\mu\text{MALL}^\infty$ , the infinitary sequent calculus for  $\mu\text{MALL}$ . Our cut elimination result extends that of Santocanale and Fortier [13], but this extension has required the elaboration of a radically different proof technique.

An obvious direction for future work is now to go beyond linear logic, and notably handle structural rules in infinitary cut elimination. But many interesting questions are also left in the linear case. First, it will be natural to relax the hypothesis on fairness in the cut-elimination result. Other than cut elimination, the other long standing problem regarding  $\mu\text{MALL}^\infty$  and similar proof systems is whether regular proofs can be translated, in general, to finitary proofs. Further, one can ask the same question, requiring in addition that the computational content of proofs is preserved in the translation. It may well be that regular  $\mu\text{MALL}^\infty$  contains more computations than  $\mu\text{MALL}$ ; even more so if one considers other classes of finitely representable infinitary proofs. It would be interesting to study how this could impact the study of programming languages for (co)recursion, and understanding links with other approaches to this question [1, 2]. In this direction, we will be interested in studying the computational interpretation of focused cut-elimination, providing a logical basis for inductive and coinductive matching in regular and infinitary proof systems.

## A Appendix relative to Section 2

In this appendix we provide a proof of Proposition 9, but also supplementary material that may be useful to better understand  $\mu\text{MALL}^\infty$ , its validity condition and its relationship to  $\mu\text{MALL}$ . Most of this material is adapted directly from classical observations about  $\mu$ -calculi, with the exception of the translation from  $\mu\text{MALL}$  to  $\mu\text{MALL}^\infty$ : it is unpublished, but we view it more as folklore than as a contribution of this paper.

### A.1 Details on the validity condition

We first provide more details and intuitions about the notion of valid thread. If a thread  $(F_i)_{i \in \omega}$  is eventually constant in terms of formula occurrences, it simply means that it traces a formula that is never principal in the branch: this formula plays no role in the proof, and there is no reason to declare the thread valid. Otherwise, addresses keep growing along the thread: at any point in the thread there is a later point where the address increases. Forgetting addresses and considering the set  $S$  of formulas that appear infinitely often in the thread, we immediately see that any two formulas  $\varphi, \psi \in S$  are *co-accessible*, i.e.,  $\psi \in \text{FL}(\varphi)$ . Indeed, if  $F_i = \varphi_\alpha$ , there must be some  $j > i$  such that  $F_j = \psi_\beta$ . In that case, the thread is valid iff the minimum of  $S$  wrt. the subformula ordering is a  $\nu$ -formula. As we shall see, this definition makes sense because that minimum is always defined. Moreover, it is always a fixed point formula, so what the definition really says is that this minimum fixed point must be a greatest fixed point for the thread to be valid. All this is justified by the following classical observation about  $\mu$ -calculi, which we restate next in our setting.

► **Proposition 39.** *Let  $t = (F_i)_{i \in \omega}$  be a thread that is not eventually constant. The set  $S$  of formulas that occur infinitely often in  $t$  admits a minimum with respect to the subformula ordering, and that minimum is a fixed point formula.*

**Proof.** We assume that all formulas of  $t$  occur infinitely often in  $t$ , and that  $F_i = \psi_\alpha$  implies  $F_{i+1} = \psi'_{\alpha a}$  for some  $a \in \Sigma$ , i.e.,  $F_{i+1}$  is an immediate descendant of  $F_i$ . This is without loss of generality, by extracting from  $t$  the infinite sub-thread of occurrences  $F_i$  whose formulas are in  $S$  and which are principal, i.e., for which  $F_{i+1} \neq F_i$ .

Let  $|\varphi|$  be the size of a formula, i.e., the number of connectives used to construct the formula. Take any  $\varphi \in S$  that has minimum size, i.e.,  $|\varphi| \leq |\psi|$  for all  $\psi \in S$ . We shall establish that  $\varphi$  must in fact be a minimum for the subformula ordering, i.e.,  $\varphi \leq \psi$  for all  $\psi \in S$ . It suffices to prove that if  $F_i = \psi_\alpha$  and  $F_j = \varphi_{\alpha\beta}$ , then  $\varphi \leq \psi$ . We proceed by induction on  $\beta$ . The result is obvious if  $\beta$  is empty, since one then has  $\varphi = \psi$ . Otherwise, we distinguish two cases:

- If  $\psi = \psi^l \star \psi^r$  and  $F_{i+1} = (\psi^a)_{\alpha a}$  for some  $a \in \{l, r\}$ , we have  $\beta = a\beta'$ . By induction hypothesis (with  $\alpha := \alpha a$  and  $\beta := \beta'$ ) we obtain that  $\varphi \leq \psi^a$ , and thus  $\varphi \leq \psi$ .
- Otherwise,  $\psi = \sigma X.\psi'$ ,  $F_{i+1} = (\psi'[\psi/X])_{\alpha i}$  and  $\beta = i\beta'$ . By induction hypothesis,  $\varphi \leq \psi'[\psi/X]$ . Since  $|\varphi| \leq |\psi|$ ,  $\varphi$  is a subformula of  $\psi'[\psi/X]$  which cannot strictly contain  $\psi$ . Thus we either have  $\varphi = \psi$  or  $\varphi \leq \psi'$ . In both cases, we conclude immediately.

We finally show that  $\varphi$  must be a fixed point formula. Take any  $i$  such that  $F_i = \varphi_\alpha$ . We have  $F_{i+1} = \psi_{\alpha a}$ . Assuming that  $\varphi$  is not a fixed point expression, it would be of the form  $\varphi_1 \star \varphi_2$  with  $\psi = \varphi_i$  for some  $1 \leq i \leq 2$ , contradicting  $|\varphi| \leq |\psi|$ . ◀

### A.2 Admissibility of the axiom

We now prove the admissibility of (Ax), by showing that infinite  $\eta$ -expansions are valid.

671 ► **Proposition (9).** *Rule (Ax) is admissible in  $\mu\text{MALL}^\infty$ .*

672 **Proof.** As is standard, any instance of (Ax) can be expanded by introducing two dual connect-  
 673 ives and concluding by (Ax) on the sub-occurrences. For instance, (Ax) on  $\vdash (\varphi \otimes \psi)_\alpha, (\psi^\perp \wp \varphi^\perp)_\beta$   
 674 is expanded by using rules ( $\wp$ ), ( $\otimes$ ), and then axioms on  $\vdash \varphi_{\alpha l}, \varphi_{\beta r}^\perp$  and  $\vdash \psi_{\alpha r}, \psi_{\beta l}^\perp$ . In  $\mu\text{MALL}^\infty$   
 675 we can co-iterate this expansion to obtain an axiom-free pre-proof from any instance of (Ax)  
 676 on  $\vdash F, G^\perp$ . On any infinite branch of that pre-proof, there are exactly two threads and  
 677 they are not eventually constant. Let  $t = (F_i)_{i \in \omega}$  and  $t' = (G_i)_{i \in \omega}$  be the corresponding  
 678 sequences of distinct sub-occurrences, *i.e.*, keeping an occurrence only when it is principal.  
 679 We actually have that, for all  $i$ ,  $F_i \equiv G_i^\perp$ . The minimum of a thread that is not eventually  
 680 constant is necessarily a fixed point formula, thus  $\min(t)$  is a  $\nu$  formula iff  $\min(t')$  is a  $\mu$ , and  
 681 one of the two threads validates the branch. ◀

### 682 A.3 Translating from $\mu\text{MALL}$ to $\mu\text{MALL}^\infty$

683 Generalizing the previous construction, we now introduce the functoriality construction,  
 684 which shall be useful to present the translation from the finitary sequent calculus  $\mu\text{MALL}$  to  
 685 its infinitary counterpart  $\mu\text{MALL}^\infty$ .

686 ► **Definition 40.** Let  $F$  be a pre-formula such that  $\text{fv}(F) \subseteq \{X_i\}_{1 \leq i \leq n}$ , and let  $\vec{\Pi} = (\Pi_i)_{1 \leq i \leq n}$   
 687 be a collection of pre-proofs of respective conclusions  $\vdash P_i, Q_i$ . We define coinductively the  
 688 pre-proof  $F(\vec{\Pi})$  of conclusion  $\vdash F^\perp[P_i/X_i]_{1 \leq i \leq n}, F[Q_i/X_i]_{1 \leq i \leq n}$  as follows:

- 689 ■ If  $F = X_i$  then  $F(\vec{\Pi}) = \Pi_i$  up to relocalization, *i.e.*, changing the addresses of occurrences  
 690 in  $\Pi_i$  to match the required ones.
- If  $F = F_1 \otimes F_2$ , then  $F(\vec{\Pi})$  is:

$$\frac{\frac{F_1(\vec{\Pi})}{\vdash F_1^\perp[P_i/X_i]_i, F_1[Q_i/X_i]_i} \quad \frac{F_2(\vec{\Pi})}{\vdash F_2^\perp[P_i/X_i]_i, F_2[Q_i/X_i]_i}}{\vdash F_2^\perp[P_i/X_i]_i, F_1^\perp[P_i/X_i]_i, (F_1 \otimes F_2)[Q_i/X_i]_i} (\otimes)$$

$$\frac{\vdash F_2^\perp[P_i/X_i]_i, F_1^\perp[P_i/X_i]_i, (F_1 \otimes F_2)[Q_i/X_i]_i}{\vdash (F_2^\perp \wp F_1^\perp)[P_i/X_i]_i, (F_1 \otimes F_2)[Q_i/X_i]_i} (\wp)$$

- If  $F = F_1 \oplus F_2$ , then  $F(\vec{\Pi})$  is:

$$\frac{\frac{F_1(\vec{\Pi})}{\vdash F_1^\perp[P_i/X_i]_i, F_1[Q_i/X_i]_i}}{\vdash F_1^\perp[P_i/X_i]_i, (F_1 \oplus F_2)[Q_i/X_i]_i} (\oplus_1) \quad \frac{\frac{F_2(\vec{\Pi})}{\vdash F_2^\perp[P_i/X_i]_i, F_2[Q_i/X_i]_i}}{\vdash F_2^\perp[P_i/X_i]_i, (F_1 \oplus F_2)[Q_i/X_i]_i} (\oplus_2)$$

$$\frac{\vdash F_1^\perp[P_i/X_i]_i, (F_1 \oplus F_2)[Q_i/X_i]_i \quad \vdash F_2^\perp[P_i/X_i]_i, (F_1 \oplus F_2)[Q_i/X_i]_i}{\vdash (F_2^\perp \& F_1^\perp)[P_i/X_i]_i, (F_1 \oplus F_2)[Q_i/X_i]_i} (\&)$$

- If  $F = \mu X.G$  then  $F(\vec{\Pi})$  is obtained from applying functoriality on  $G$  with  $F(\vec{\Pi})$  as the  
 derivation for the new free variable  $X_{n+1} := X$ :

$$\frac{G(\vec{\Pi}, F(\vec{\Pi}))}{\vdash G^\perp[(\nu X.G^\perp)/X][P_i/X_i]_i, G[(\mu X.G)/X][Q_i/X_i]_i} (\mu)$$

$$\frac{\vdash G^\perp[(\nu X.G^\perp)/X][P_i/X_i]_i, (\mu X.G)[Q_i/X_i]_i}{\vdash (\nu X.G^\perp)[P_i/X_i]_i, (\mu X.G)[Q_i/X_i]_i} (\nu)$$

- 691 ■ If  $F = \mathbf{0}$  then  $F(\vec{\Pi})$  is directly obtained by applying ( $\top$ ) on  $F^\perp[P_i/X_i]_i$ .
- 692 ■ If  $F = \mathbf{1}$  then  $F(\vec{\Pi})$  is obtained by applying rule ( $\perp$ ) followed by ( $\mathbf{1}$ ).

693 ■ Other cases are treated symmetrically.

694 As said above, the construction  $F(\vec{\Pi})$  is a generalization of the infinitary  $\eta$ -expansion,  
695 where the derivations  $\Pi_i$  are plugged where free variables are encountered. In fact, if  $F$  is a  
696 closed pre-formula, then  $F()$  is the derivation constructed in the proof of Proposition 9.

697 Also note that, since only finitely many sequents may arise in the process of constructing  
698  $F(\vec{\Pi})$ , and since the construction is entirely guided by its end sequent, the derivation  $F(\vec{\Pi})$   
699 is actually regular as long as the derivations  $\Pi_i$  are regular as well.

700 An infinite branch of  $F(\vec{\Pi})$  either has an infinite branch of some  $\Pi_i$  as a suffix, or is only  
701 visiting sequents of  $F(\vec{\Pi})$  that are not sequents of the input derivations  $\vec{\Pi}$ . In the former  
702 case, the branch is valid provided that the input derivations are valid. In the latter case, the  
703 branch contains exactly two dual threads (as in the proof of Proposition 9), one of which must  
704 be valid. Thus,  $F(\vec{\Pi})$  is a proof provided that the input derivations are proofs. This result is  
705 however not usable directly to prove the validity of a pre-proof in which we make repeated  
706 use of functoriality, *i.e.*, one where branches may go through infinitely many successive uses  
707 of functoriality.

708 We now make use of functoriality to translate finitary  $\mu\text{MALL}$  proofs (corresponding to  
709 the propositional fragment of [4]) to infinitary derivations.

► **Definition 41** ( $\mu\text{MALL}$  sequent calculus). The sequent calculus for the propositional  
fragment of  $\mu\text{MALL}$  is a finitary sequent calculus whose rules are the same as those of  
 $\mu\text{MALL}^\infty$ , except that the  $\nu$  rule is as follows:

$$\frac{\vdash S^\perp, F[S/X]}{\vdash S^\perp, \nu X.F}$$

The  $\nu$  rule corresponds to reasoning by coinduction. In [4] it is found in a slightly different  
form, which can be obtained from the above version by means of cut:

$$\frac{\vdash \Gamma, S \quad \vdash S^\perp, F[S/X]}{\vdash \Gamma, \nu X.F}$$

710 ► **Definition 42** (Translation from  $\mu\text{MALL}$  to  $\mu\text{MALL}^\infty$ ). Given a  $\mu\text{MALL}$  proof  $\Pi$  of  $\vdash \Gamma$ , we  
711 define coinductively the  $\mu\text{MALL}^\infty$  pre-proof  $\Pi^i$  of  $\vdash \Gamma$ , as follows:

■ If  $\Pi$  starts with an inference that is present in  $\mu\text{MALL}^\infty$ , we use the same inference and  
proceed co-recursively. For instance,

$$\Pi = \frac{\frac{\Pi_1}{\vdash \Gamma', F} \quad \frac{\Pi_2}{\vdash G, \Gamma''}}{\vdash \Gamma', F \otimes G, \Gamma''} \quad \text{yields} \quad \Pi^i = \frac{\frac{\Pi_1^i}{\vdash \Gamma', F} \quad \frac{\Pi_2^i}{\vdash G, \Gamma''}}{\vdash \Gamma', F \otimes G, \Gamma''}.$$

■ Otherwise,  $\Pi$  starts with an instance of the  $\nu$  rule of  $\mu\text{MALL}$ :

$$\Pi = \frac{\Pi_1}{\vdash S^\perp, F[S/X]} \quad \vdash S^\perp, \nu X.F$$

We transform it as follows, where  $(F)$  denotes a use of the functoriality construction:

$$\Pi^i = \frac{\frac{\Pi_1^i}{\vdash S^\perp, F[S/X]} \quad \frac{\frac{\Pi^i}{\vdash S^\perp, \nu X.F}}{\vdash F^\perp[S^\perp/X], F[(\nu X.F)/X]} (F)}{\vdash S^\perp, F[(\nu X.F)/X]} (Cut) \quad \vdash S^\perp, \nu X.F$$

This construction induces infinite branches, some of which being contained in the functoriality construct, and some of which that encounter infinitely often the sequent  $\vdash S^\perp, \nu X.F$  (up-to structural equivalence). Note that a branch that eventually goes to the left of the above (Cut) cannot cycle back to  $\vdash S^\perp, \nu X.F$  anymore. It may still be infinite, going through other cycles obtained from the translation of other coinduction rules in  $\Pi_1$ .

As a side remark, note that if  $\Pi$  is cut-free, then so is  $\Pi^i$ . Of course, if  $\Pi$  is cut-free but uses the version of the  $\nu$  rule that embeds a cut, this is not true anymore.

► **Proposition 43.** *For any  $\mu\text{MALL}$  derivation  $\Pi$ , its translation  $\Pi^i$  is a  $\mu\text{MALL}^\infty$  proof.*

**Proof sketch.** We have to check that all infinite branches of  $\Pi^i$  are valid. Consider one such infinite branch. After a finite prefix, the branch must be contained in the pre-proof obtained from the translation of a coinduction rule (second case in the above definition). If the branch is eventually contained in a functoriality construct, then it contains two dual threads, and is thus valid. Otherwise, the branch visits infinitely often (up-to structural equivalence) the sequent  $\vdash S^\perp, \nu X.F$  corresponding to our translated coinduction rule. The branch in  $\Pi^i$  contains a thread that contains the successive sub-occurrences of  $\nu X.F$  in those sequents. More specifically, that formula is principal infinitely often in the thread. It only remains to show that it is minimal among formulas that appear infinitely often: this simply follows from the fact that formulas encountered along the thread inside the functoriality construct ( $F$ ) all contain  $\nu X.F$  as a subformula. ◀

## B Appendix relative to Section 3

In this appendix, we first prove results corresponding to Section 3 and then develop a complete example of focusing process, in order to exemplify the different concepts and objects defined in Section 3:

- reversibility of negative inference;
- focalization graph;
- focusing on positive inference;
- stepwise construction, by alternation of the two above – asynchronous and synchronous – phases, of a focusing proof from any given proof.

### B.1 Polarity of connectives

► **Proposition (11).** *An infinite branch of a pre-proof containing only negative (resp. positive) rules is always valid (resp. invalid).*

**Proof.** An infinite negative branch contains only greatest fixed points. Among the threads, some are not eventually constant and their minimal formulas are  $\nu$ -formulas: they are valid threads.

An infinite positive branch cannot be valid since for any non-constant thread  $t$ ,  $\min(t)$ , its minimal formula, is a  $\mu$ -formula. ◀

### B.2 Reversibility

Before proving that **rev** actually builds a reversed proof, we first consider a simplified proof transformation for a proof  $\pi$  of a sequent  $\vdash \Gamma, N$ ,  $\text{rev}_0(\pi, N)$ , the effect of which being to reverse only the topmost connective of  $N$ . It is defined similarly to **rev** except that the procedure is not called on the subproofs contrarily to definition 13.

► **Definition 44** ( $\text{rev}_0(\pi, N)$ ). We define  $\text{rev}_0(\pi, N)$  to be the pre-proof

$$\frac{\pi(1, N) \quad \dots \quad \pi(\text{sl}(N), N)}{\vdash \Gamma, N} \text{ (r}_N\text{)}.$$

753 ► **Proposition 45.** *Let  $\pi$  be a  $\mu\text{MALL}^\infty$  proof of  $\vdash \Gamma, N$ .  $\text{rev}_0(\pi, N)$  is a  $\mu\text{MALL}^\infty$  proof.*

754 **Proof.** The reader will easily check that any infinite branch  $\beta$  of  $\text{rev}_0(\pi, N)$  is obtained from  
 755 a branch  $\alpha$  of  $\pi$ , either of the form  $(r_N) \cdot \alpha$  when  $\alpha$  does not contain an inference on  $N$  or  
 756  $(r_N) \cdot \alpha_1 \dots \alpha_{n-1} \cdot \alpha_{n+1} \dots$  where  $\alpha_n$  has  $N$  a principal formula (occurrence). Validating  
 757 threads are therefore preserved. ◀

758 We can now consider the general case of  $\text{rev}$ :

759 ► **Theorem (16).** *Let  $\pi$  be a  $\mu\text{MALL}^\infty$  proof.  $\text{rev}(\pi)$  is a reversed proof of the same sequent.*

760 **Proof.**  $\text{rev}$  is obviously productive: each recursive call is guarded. Inferences of  $\text{rev}(\pi)$  are  
 761 locally valid: if  $\pi$  is a preproof, so is  $\text{rev}(\pi)$ .

762 If moreover  $\pi$  is a proof, infinite branches of  $\text{rev}(\pi)$  are valid: indeed, infinite branches of  
 763  $\text{rev}(\pi)$  are either fully negative (and therefore valid) or after a certain point they coincide  
 764 with inferences of an infinite branch of  $\pi$  and their validity follows that of  $\pi$ .

765 The resulting proof is obviously shown to be reversed: we do not find any positive  
 766 inference on any branch of  $\text{rev}(\pi)$ , until the first positive sequent is reached. ◀

## 767 B.3 Focalization graphs

768 ► **Proposition (18).** *The positive trunk of a  $\mu\text{MALL}^\infty$  proof is always finite.*

769 **Proof.** The positive trunk of a proof cannot have infinite branches, because they would be  
 770 infinite positive branches of the original proof, thus necessarily invalid by proposition 11. ◀

771 ► **Proposition (20).** *Focalization graphs are acyclic.*

772 Even though the proof directly adapts the argument from [20], we provide it for com-  
 773 pleteness:

774 **Proof.** We prove the result by *reductio ad absurdum*. Let  $\mathcal{S}$  be a positive sequent with a  
 775 proof  $\pi$ . Let  $\pi^+$  be the corresponding positive trunk and  $\mathcal{G}$  the associated Focalization Graph.  
 776 Suppose that  $\mathcal{G}$  has a cycle and consider such a cycle of minimal length  $(F_1 \rightarrow F_2 \rightarrow \dots \rightarrow$   
 777  $F_n \rightarrow F_1)$  in  $\mathcal{G}$  and let us consider  $\mathcal{S}_1, \dots, \mathcal{S}_n$  sequents of the border justifying the arrows of  
 778 the cycle.

779 These sequents are actually uniquely defined or the exact same reason as in MALL [20].  
 780 With the same idea we can immediately notice that the cycle is necessarily of length  $n \geq 2$   
 781 since two  $\prec$ -subformulas of the same formula can never be in the same sequent in the border  
 782 of the positive trunk.

783 Let  $\mathcal{S}_0$  be  $\bigwedge_{i=1}^n \mathcal{S}_i$  be the highest sequent in  $\pi$  such that all the  $\mathcal{S}_i$  are leaves of the tree  
 784 rooted in  $\mathcal{S}_0$ . We will obtain the contradiction by studying  $\mathcal{S}_0$  and we will reason by case on  
 785 the rule applied to this sequent  $\mathcal{S}_0$ :

786 ■ the rule cannot be (1) rule since this rule produces no premiss and thus we would have  
 787 an empty cycle which is non-sens. Any rule with no premiss would lead to the same  
 788 contradiction.

789 ■ If the rule is one of  $(\oplus_i)$  or  $(\mu)$ , then the premiss  $\mathcal{S}'_0$  of the rule would also satisfy  
 790 the condition required for  $\mathcal{S}_0$  (all the  $\mathcal{S}_i$  would be part of the proof tree rooted in  $\mathcal{S}'_0$ )  
 791 contradicting the maximality of  $\mathcal{S}_0$ . If the rule is any other non-branching rule, maximality  
 792 of  $\mathcal{S}_0$  would also be contradicted.  
 793 ■ Thus the rule shall be branching: it shall be a  $(\otimes)$ . Write  $\mathcal{S}_L$  and  $\mathcal{S}_R$  for the left and  
 794 right premisses of  $\mathcal{S}_0$ . Let  $G = G_L \otimes G_R$  be the principal formula in  $\mathcal{S}_0$  and let  $F$  be the  
 795 active formula of the Trunk such that  $F \prec G$ .  
 796 There are two possibilities:

797  
 798 (i) either  $F \in \{F_1, \dots, F_n\}$  and  $F$  is the only formula of the cycle having at the same  
 799 time  $\prec$ -subformulas in the left premiss and in the right premiss,

800  
 801 (ii) or  $F \notin \{F_1, \dots, F_n\}$  and no formula of the cycle has  $\prec$ -subformulas in both premisses.  
 802 Let thus  $I_L$  (resp.  $I_R$ ) be the sets of indices of the active formulas of the root  $\mathcal{S}$  having  
 803 ( $\prec$ -related) subformulas only in the left (resp. right) premiss. Clearly neither  $I_L$  nor  $I_R$   
 804 is empty since it would contradict the maximality of  $\mathcal{S}_0$ . Indeed if  $I_L = \emptyset$ , then  $\mathcal{S}_R$   
 805 satisfies the condition of being dominated by all the  $\mathcal{S}_i$ ,  $1 \leq i \leq n$  and  $\mathcal{S}_0$  is not maximal  
 806 anymore. By definition of the two sets of indices we have of course  $I_L \cap I_R = \emptyset$  and the  
 807 only formula of the cycle possibly not in  $I_L \cup I_R$  is  $F$  if we are in the case (i): all other  
 808 formulas in the cycle have their index either in  $I_L$  or in  $I_R$ .

809 As a consequence there must be an arrow in the cycle (and thus in the graph) from a  
 810 formula in  $I_L$  to a formula in  $I_R$  (or the opposite). Let  $i \in I_L$  and  $j \in I_R$  be such indexes  
 811 (say for instance  $F_i \rightarrow F_j$  in  $\mathcal{G}$ ) and let  $\mathcal{S}'$  be the sequent of the border responsible for  
 812 this edge.  $\mathcal{S}'$  contains  $F'_i$  and  $F'_j$  and by definition of the sets  $I_L$  and  $I_R$ ,  $\mathcal{S}'$  cannot be in  
 813 the tree rooted in  $\mathcal{S}_0$  which is in contradiction with the way we constructed  $\mathcal{S}_0$ .

814 Then there cannot be any cycle in the focalization graph. ◀

815 ► **Proposition (22).** *Let  $\mathcal{S}$  be a lowest sequent of  $\text{foc}(\pi, P)$  which is not conclusion of a*  
 816 *rule on a positive subformula of  $P$ . Then  $\mathcal{S}$  contains exactly one subformula of  $P$ , which is*  
 817 *negative.*

818 **Proof.**  $\text{foc}(\pi, P)$  is such that the maximal prefix containing only rules applied to  $P$  and  
 819 its positive subformulas decomposes  $P$  up to its negative subformulas. Uniqueness of the  
 820 subformula in the case of MALL, treated in [20], can be directly adapted here. ◀

## 821 B.4 Productivity and validity of the focalization process

822 ► **Proposition (23).** *Let  $\pi$  be a  $\mu\text{MALL}^\infty$  proof,  $r$  a positive rule occurring in  $\pi$  and  $r'$  be a*  
 823 *negative rule occurring below  $r$  in  $\pi$ . If  $r$  occurs in  $\text{Foc}(\pi)$ , then  $r'$  occurs in  $\text{Foc}(\pi)$ , below  $r$ .*

824 **Proof.** The proposition amounts to the simple remark that none of the transformation we  
 825 do, for  $\text{foc}$  and  $\text{rev}$ , will ever permute a positive *below* a negative.

826 The proposition is thus satisfied by both transformations  $\text{foc}$  and  $\text{rev}$  and thus holds for  
 827  $\text{Foc}(\pi)$  which results from the iteration of the reversibility and focalization processes. ◀

828 ► **Lemma (24).** *For any infinite branch  $\gamma$  of  $\text{Foc}(\pi)$  containing an infinite number of positive*  
 829 *rules, there exists an infinite branch in  $\pi$  containing infinitely many positive rules of  $\gamma$ .*

830 **Proof.** The lemma results from a simple application of Koenig's lemma. ◀

831 ► **Theorem (25).** *If  $\pi$  is a  $\mu\text{MALL}^\infty$  proof then  $\text{Foc}(\pi)$  is also a  $\mu\text{MALL}^\infty$  proof.*

**Proof.** Let  $\gamma$  be an infinite branch of  $\text{Foc}(\pi)$ . If, at a certain point,  $\gamma$  is obtained by reversibility only, then it contains only negative rules and is therefore valid.

Otherwise,  $\gamma$  has been obtained by alternating infinitely often focalization phases **foc** and reversibility phases **rev** as described above. It therefore contains infinitely many positive inferences. By Lemma 24, there exists an infinite branch  $\delta$  of  $\pi$  containing an infinite number of positive rules of  $\gamma$ . Since  $\delta$  is valid, it contains a valid thread  $t$ .

Let  $F_m$  be the minimal formula of thread  $t$ , a  $\nu$ -formula, and  $(r_i)_{i \in \omega}$  the rules of  $\delta$  in which  $F_m$  is the principal formula.

For any  $i$ , there exists a positive rule  $r'_i$  occurring in  $\gamma$  which is above  $r_i$  and  $r_i$  therefore also appears in  $\gamma$  by Proposition 23, which is therefore valid.  $\blacktriangleleft$

## B.5 An Example of Focalization

To conclude this section of the appendices, we present a detailed example of a focalization process in order to illustrate the material developped in the section of the paper devoted to focalization.

Let us consider the following proof of sequent

$$\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}), (\mu X.X) \otimes \mathbf{1}.$$

$$\frac{\frac{\frac{\vdots}{\vdash \nu X.X, \mathbf{1}} (\nu)}{\vdash (\nu X.X) \otimes (\nu X.X), \mathbf{1}, \mathbf{0}} (\otimes) \quad \frac{\frac{\vdots}{\vdash \nu X.X, \mathbf{0}} (\nu)}{\vdash (\nu X.X) \otimes (\nu X.X), \mathbf{1} \wp \mathbf{0}} (\wp) \quad \frac{\frac{\vdots}{\vdash \nu X.X, \mu X.X} (\nu), (\mu)}{\vdash \nu X.X, \mu X.X} (\nu)}{\vdash (\nu X.X) \otimes (\nu X.X), (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}), \mu X.X} (\otimes)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}), \mu X.X} (\oplus_2)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}), \mu X.X} (\mu)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}), (\mu X.X) \otimes \mathbf{1}} (\otimes)} \quad \frac{}{\vdash \mathbf{1}} (\mathbf{1})$$

The Positive Trunk corresponding to this proof is:

$$\frac{\frac{\vdash (\nu X.X) \otimes (\nu X.X), \mathbf{1} \wp \mathbf{0} \quad \vdash \nu X.X, \mu X.X}{} (\otimes)}{\vdash (\nu X.X) \otimes (\nu X.X), (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}), \mu X.X} (\oplus_2)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}), \mu X.X} (\mu)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}), (\mu X.X) \otimes \mathbf{1}} (\otimes)} \quad \frac{}{\vdash \mathbf{1}} (\mathbf{1})$$

and the Border is made of only two sequents:

$$\{\vdash (\nu X.X) \otimes (\nu X.X), \mathbf{1} \wp \mathbf{0} \quad ; \quad \vdash \nu X.X, \mu X.X\}$$

the Active Formulas of the positive trunk are thus:

- $\mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X))$
- $(\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0})$
- $(\mu X.X) \otimes \mathbf{1}$

852 the Focalization Graph, which has thus those three formulas as vertices, is the following:

$$(\mu X.X) \otimes \mathbf{1} \longleftarrow (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}) \longrightarrow \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X))$$

853 which is indeed acyclic and has a single source,  $(\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0})$ , which we pick as focus.  
By rewriting the Propositive Trunk we arrive at

$$\frac{\frac{\pi_1}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), \mathbf{1} \wp \mathbf{0}} \quad \frac{\pi_2}{\vdash \nu X.X, (\mu X.X) \otimes \mathbf{1}}}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}), (\mu X.X) \otimes \mathbf{1}} (\otimes)$$

with

$$\pi_1 = \frac{\frac{\frac{\vdots}{\vdash \nu X.X, \mathbf{1}} (\nu) \quad \frac{\vdots}{\vdash \nu X.X, \mathbf{0}} (\nu)}{\vdash (\nu X.X) \otimes (\nu X.X), \mathbf{1}, \mathbf{0}} (\otimes)}{\vdash (\nu X.X) \otimes (\nu X.X), \mathbf{1} \wp \mathbf{0}} (\wp)} (\oplus_2) \quad \text{and} \quad \pi_2 = \frac{\frac{\frac{\vdots}{\vdash \nu X.X, \mu X.X} (\nu), (\mu)}{\vdash \nu X.X, \mu X.X} (\nu)}{\vdash \nu X.X, \mu X.X} (\mu)}{\vdash \nu X.X, (\mu X.X) \otimes \mathbf{1}} (\otimes) \quad \frac{}{\vdash \mathbf{1}} (\mathbf{1})$$

854 and we continue by focalizing  $\pi_1$  and  $\pi_2$ .

As for  $\pi_1$ , its conclusion is a negative sequent, so that one first considers  $\text{rev}(\pi_1)$ :

$$\text{rev}(\pi_1) = \frac{\frac{\frac{\frac{\vdots}{\vdash \nu X.X, \mathbf{1}} (\nu) \quad \frac{\vdots}{\vdash \nu X.X, \mathbf{0}} (\nu)}{\vdash (\nu X.X) \otimes (\nu X.X), \mathbf{1}, \mathbf{0}} (\otimes)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), \mathbf{1}, \mathbf{0}} (\oplus_2)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), \mathbf{1} \wp \mathbf{0}} (\wp)}$$

$\text{rev}(\pi_1)$  is actually already focused: the conclusion of

$$\frac{\frac{\frac{\vdots}{\vdash \nu X.X, \mathbf{1}} (\nu) \quad \frac{\vdots}{\vdash \nu X.X, \mathbf{0}} (\nu)}{\vdash (\nu X.X) \otimes (\nu X.X), \mathbf{1}, \mathbf{0}} (\otimes)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), \mathbf{1}, \mathbf{0}} (\oplus_2)}$$

is a positive sequent and its positive trunk is:

$$\frac{\frac{\vdash \nu X.X, \mathbf{1} \quad \vdash \nu X.X, \mathbf{0}}{\vdash (\nu X.X) \otimes (\nu X.X), \mathbf{1}, \mathbf{0}} (\otimes)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), \mathbf{1}, \mathbf{0}} (\oplus_2)}$$

855 This positive trunk contains only one active formula which therefore is automatically chosen  
856 as a focus (and the positive trunk actually already focused on it).

Subproofs

$$\frac{\vdots}{\vdash \nu X.X, \mathbf{1}} (\nu) \quad \frac{\vdots}{\vdash \nu X.X, \mathbf{0}} (\nu)$$

857 are infinite negative branches and therefore reversed, focused proofs.

858 As for  $\pi_2$ , its conclusion is also a negative sequent so that we build  $\text{rev}(\pi_2)$  which turns  
859 out to be focused as it is reduced to an infinite negative branch of  $(\nu)$  rules:

$$\text{rev}(\pi_2) = \frac{\vdots}{\vdash \nu X.X, (\mu X.X) \otimes \mathbf{1}} (\nu)$$

860 To sum up, the focused proof associated with our starting proof object is:

$$\frac{\frac{\frac{\vdots}{\vdash \nu X.X, \mathbf{1}} (\nu) \quad \frac{\vdots}{\vdash \nu X.X, \mathbf{0}} (\nu)}{\vdash (\nu X.X) \otimes (\nu X.X), \mathbf{1}, \mathbf{0}} (\otimes) \quad \frac{\vdots}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), \mathbf{1}, \mathbf{0}} (\oplus_2)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), \mathbf{1} \wp \mathbf{0}} (\wp) \quad \frac{\vdots}{\vdash \nu X.X, (\mu X.X) \otimes \mathbf{1}} (\nu)}{\vdash \mathbf{0} \oplus ((\nu X.X) \otimes (\nu X.X)), (\nu X.X) \otimes (\mathbf{1} \wp \mathbf{0}), (\mu X.X) \otimes \mathbf{1}} (\otimes)$$

## 861 **C** Appendix relative to Section 4

### 862 **C.1** Detailed definitions

863 We first give a detailed description of the multicut reduction rules. In order to treat the  
864 external reduction for the tensor, we first need to introduce a few preliminary definitions.  
865 Given a sequent  $\vdash \Gamma, \Delta, F \otimes G$  that is a premise of a multicut, we need to define which part  
866 of the multicut is connected to  $\Gamma$  and which part is connected to  $\Delta$ . These two sub-nets,  
867 respectively called  $\mathcal{C}_\Gamma$  and  $\mathcal{C}_\Delta$ , will be split apart in the external tensor reduction.

868 ► **Definition 46.** We call *cut net* any set of sequents  $\{s_i\}_i$  that forms a valid set of premises  
869 for the multicut rule, *i.e.*, a connected acyclic graph for the cut-connection relation. The  
870 conclusion of a cut net is the conclusion that the multicut rule would have with the cut net as  
871 premise, *i.e.*, the set of formula occurrences that appear in the net but not as cut formulas.

872 ► **Definition 47.** Let  $\mathcal{M}$  be a cut net, and  $F$  be a formula occurrence appearing in some  
873  $s \in \mathcal{M}$ . We define  $\mathcal{C}_F \subseteq \mathcal{M}$  as follows. If  $F^\perp \in s'$  for some  $s' \in \mathcal{M}$ , then  $\mathcal{C}_F$  is the connected  
874 component of  $\mathcal{M} \setminus \{s\}$  containing  $s'$ . Otherwise,  $\mathcal{C}_F = \emptyset$ . If  $\Delta$  is a set of formula occurrences,  
875 we define  $\mathcal{C}_\Delta := \bigcup_{F \in \Delta} \mathcal{C}_F$ .

876 ► **Proposition 48.** Let  $s = \vdash F, \Delta, \Gamma$  be a sequent, and  $\mathcal{M} = \{s\} \cup \mathcal{C}$  be a cut net of conclusion  
877  $\vdash F, \Sigma$ . One has  $\mathcal{C} = \mathcal{C}_\Delta \uplus \mathcal{C}_\Gamma$ . Moreover,  $\{\vdash \Gamma\} \cup \mathcal{C}_\Gamma$  and  $\{\vdash \Delta\} \cup \mathcal{C}_\Delta$  are cut nets and, if  
878  $\Sigma_\Gamma$  and  $\Sigma_\Delta$  are their respective conclusions, we have  $\Sigma = \Sigma_\Delta \uplus \Sigma_\Gamma$ .

► **Definition 49** (Multicut reduction rules). *Principal and external reductions* are re-  
spectively defined in Figure 4 and 5. *Internal reduction* is the union of merge and principal  
reductions. *Merge reduction* is defined as follows, with  $r = (\text{merge}, \{F, F^\perp\})$ :

$$\frac{\mathcal{C} \quad \frac{\vdash \Delta, F \quad \vdash \Gamma, F^\perp}{\vdash \Delta, \Gamma} (\text{Cut})}{\vdash \Sigma} (\text{mcut}) \xrightarrow{r} \frac{\mathcal{C} \quad \vdash \Delta, F \quad \vdash \Gamma, F^\perp}{\vdash \Sigma} (\text{mcut})$$

879 We can now provide more explicit notions of reduction sequences and fairness.

880 ► **Definition 50.** A *multicut reduction sequence* is a finite or infinite sequence  $\sigma =$   
881  $(\pi_i, r_i)_{i \in \lambda}$ , with  $\lambda \in \omega + 1$ , where the  $\pi_i, r_i$  are pairs of  $\mu\text{MALL}_m^\infty$  proofs and  $r_i$  is label  
882 identifying a multicut reduction rule and, whenever  $i + 1 \in \lambda$ ,  $\pi_i \xrightarrow{r_i} \pi_{i+1}$ .

883 The following definition of fair reduction is standard from rewriting theory (see for  
884 instance chapter 9 of [25], definition 4.9.10):

$$\begin{array}{c}
\frac{\mathcal{C} \quad \frac{\vdash \Delta, F \quad \vdash \Gamma, G}{\vdash \Delta, \Gamma, F \otimes G} (\otimes) \quad \frac{\vdash \Theta, G^\perp, F^\perp}{\vdash \Theta, G^\perp \wp F^\perp} (\wp)}{\vdash \Sigma} \text{ (mcut)} \\
\frac{\mathcal{C} \quad \vdash \Delta, F \quad \vdash \Gamma, G \quad \vdash \Theta, G^\perp, F^\perp}{\vdash \Sigma} \xrightarrow[r]{\text{ (mcut)}} \\
\frac{\mathcal{C} \quad \frac{\vdash \Delta, F_2 \quad \vdash \Delta, F_1}{\vdash \Delta, F_2 \& F_1} (\&) \quad \frac{\vdash \Gamma, F_i^\perp}{\vdash \Gamma, F_1^\perp \oplus F_2^\perp} (\oplus_i)}{\vdash \Sigma} \text{ (mcut)} \\
\frac{\mathcal{C} \quad \vdash \Delta, F_i \quad \vdash \Gamma, F_i^\perp}{\vdash \Sigma} \xrightarrow[r]{\text{ (mcut)}} \\
\frac{\mathcal{C} \quad \frac{\vdash \Delta, F[\mu X.F/X]}{\vdash \Delta, \mu X.F} (\mu) \quad \frac{\vdash \Gamma, F^\perp[\nu X.F^\perp/X]}{\vdash \Gamma, \nu X.F^\perp} (\nu)}{\vdash \Sigma} \text{ (mcut)} \\
\frac{\mathcal{C} \quad \vdash \Delta, F[\mu X.F/X] \quad \vdash \Gamma, F^\perp[\nu X.F^\perp/X]}{\vdash \Sigma} \xrightarrow[r]{\text{ (mcut)}} \\
\frac{\mathcal{C} \quad \frac{\vdash \Gamma}{\vdash \Gamma, \perp} (\perp) \quad \overline{\vdash \mathbf{1}} (1)}{\vdash \Sigma} \text{ (mcut)} \xrightarrow[r]{\text{ (mcut)}} \frac{\mathcal{C} \quad \vdash \Gamma}{\vdash \Sigma} \text{ (mcut)}
\end{array}$$

■ **Figure 4** Principal reductions, where  $r = (\text{principal}, \{F, F^\perp\})$  with  $\{F, F^\perp\}$  the principal formulas that have been reduced.

$$\begin{array}{c}
\frac{\mathcal{C} \quad \frac{\vdash \Delta, F \quad \vdash \Gamma, G}{\vdash \Delta, \Gamma, F \otimes G} (\otimes)}{\vdash \Sigma_\Delta, \Sigma_\Gamma, F \otimes G} \text{ (mcut)} \xrightarrow[r]{\text{ (mcut)}} \frac{\mathcal{C}_\Delta \quad \vdash \Delta, F}{\vdash \Sigma_\Delta, F} \text{ (mcut)} \quad \frac{\mathcal{C}_\Gamma \quad \vdash \Gamma, G}{\vdash \Sigma_\Gamma, G} \text{ (mcut)} \\
\frac{\vdash \Sigma_\Delta, \Sigma_\Gamma, F \otimes G}{} (\otimes) \\
\frac{\mathcal{C} \quad \frac{\vdash \Delta, F, G}{\vdash \Delta, F \wp G} (\wp)}{\vdash \Sigma, F \wp G} \text{ (mcut)} \xrightarrow[r]{\text{ (mcut)}} \frac{\mathcal{C} \quad \vdash \Delta, F, G}{\vdash \Sigma, F, G} \text{ (mcut)} \\
\frac{\vdash \Sigma, F, G}{\vdash \Sigma, F \wp G} (\wp) \\
\frac{\mathcal{C} \quad \frac{\vdash \Delta, F \quad \vdash \Delta, G}{\vdash \Delta, F \& G} (\&)}{\vdash \Sigma, F \& G} \text{ (mcut)} \xrightarrow[r]{\text{ (mcut)}} \frac{\mathcal{C} \quad \vdash \Delta, F}{\vdash \Sigma, F} \text{ (mcut)} \quad \frac{\mathcal{C} \quad \vdash \Delta, G}{\vdash \Sigma, G} \text{ (mcut)} \\
\frac{\vdash \Sigma, F \& G}{\vdash \Sigma, F \& G} (\&) \\
\frac{\mathcal{C} \quad \frac{\vdash \Delta, F_i}{\vdash \Delta, F_1 \oplus F_2} (\oplus_i)}{\vdash \Sigma, F_1 \oplus F_2} \text{ (mcut)} \xrightarrow[r]{\text{ (mcut)}} \frac{\mathcal{C} \quad \vdash \Delta, F_i}{\vdash \Sigma, F_i} \text{ (mcut)} \\
\frac{\vdash \Sigma, F_1 \oplus F_2}{\vdash \Sigma, F_1 \oplus F_2} (\oplus_i) \\
\frac{\mathcal{C} \quad \overline{\vdash \Delta, \top_\alpha} (\top)}{\vdash \Sigma, \top_\alpha} \text{ (mcut)} \xrightarrow[r]{\text{ (mcut)}} \overline{\vdash \Sigma, \top_\alpha} (\top) \\
\frac{\mathcal{C} \quad \frac{\vdash \Delta}{\vdash \Delta, \perp_\alpha} (\perp)}{\vdash \Sigma, \perp_\alpha} \text{ (mcut)} \xrightarrow[r]{\text{ (mcut)}} \frac{\mathcal{C} \quad \vdash \Delta}{\vdash \Sigma} \text{ (mcut)} \quad \frac{\overline{\vdash \mathbf{1}} (1)}{\vdash \mathbf{1}} \text{ (mcut)} \xrightarrow[r]{\text{ (mcut)}} \overline{\vdash \mathbf{1}} (1)
\end{array}$$

■ **Figure 5** External reductions rules, where  $r = (\text{ext}, F)$  and  $F$  is the formula occurrence that is principal after the rule application.

885 ► **Definition 51** (Fair reduction sequences). A *multicut reduction sequence*  $(\pi_i, r_i)_{i \in \lambda}$  is  
 886 *fair* if for every  $i \in \lambda$  and  $r$  such that  $\pi_i \xrightarrow{r} \pi'$ , there is some  $j \geq i$ ,  $j \in \lambda$ , such that  $\pi_j$   
 887 contains no residual of  $r$ .

888 Fairness is defined in the same way for a reduction path rather than a reduction sequence.  
 889 In that case, fairness can be rephrased in a simpler way: A *multicut reduction path*  
 890  $(\pi_i, r_i)_{i \in \lambda}$  is *fair* if for every  $i \in \lambda$  and  $r$  such that  $\pi_i \xrightarrow{r} \pi'$ , there is some  $j \geq i$ ,  $j \in \lambda$ ,  
 891 such that  $r$  has disappeared from  $\pi_{j+1}$  (or:  $r_j$  is  $r$  or  $r_j$  erases  $r$ ).

892 Note that reduction paths issued from a fair reduction sequence are always fair.

We end this section with more details on definition 28, which defines useless sequents. Useless sequents of sort (3) and (4) are useless only because we are considering a reduction path and not a reduction sequence. Writing  $\Rightarrow$  for the reduction steps associated to reduction paths, we can more explicitly say that the sequent  $\vdash \Gamma, F_i$  is useless of sort (3) with distinguished formula  $F_i$  if, at some point in the reduction path, one of the following reductions is performed (with  $\{i, j\} = \{1, 2\}$ ):

$$\frac{\mathcal{C} \quad \frac{\vdash \Gamma, F_1 \quad \vdash \Gamma, F_2}{\vdash \Gamma, F_1 \& F_2} (\&) \quad (\text{mcut})}{\vdash \Sigma, F_1 \& F_2} \xRightarrow{r_i} \frac{\mathcal{C} \quad \vdash \Gamma, F_j}{\vdash \Sigma, F_j} (\text{mcut})$$

$$\frac{\mathcal{C} \quad \frac{\vdash \Gamma, F_i \quad \vdash \Delta, F_j}{\vdash \Delta, \Gamma, F_1 \otimes F_2} (\otimes) \quad (\text{mcut})}{\vdash \Sigma_\Delta, \Sigma_\Gamma, F_1 \otimes F_2} \xRightarrow{r_i} \frac{\mathcal{C}_\Delta \quad \vdash \Delta, F_j}{\vdash \Sigma_\Delta, F_j} (\text{mcut})$$

893 Moreover, the second reduction renders all sequents of  $\mathcal{C}_\Gamma$  useless of sort (4). Their  
 894 distinguished formulas are cut formulas, chosen based on a traversal of the acyclic graph  $\mathcal{C}_\Gamma$ ,  
 895 in a way which ensures that  $G$  and  $G^\perp$  are never both distinguished. In particular, for each  
 896  $s' \in \mathcal{C}_\Gamma$  that is cut-connected to  $\vdash \Gamma, F_i$  on  $G$ , we choose  $G^\perp$  as the distinguished formula of  
 897  $s'$ . More precisely, we define the distinguished formulas of  $\mathcal{C}_\Gamma$  inductively as follows:

- 898 ■ The distinguished formula of  $\Gamma, F_i$  is  $F_i$ .
- 899 ■ If the distinguished formula of a sequent  $s$  has been defined, and if  $s'$  cut-connected to  $s$   
 900 on  $G \in s'$ , we choose  $G$  as the distinguished formula of  $s'$ .
- 901 Notice that two dual cut formulas  $G$  and  $G^\perp$  can never both be distinguished.

## 902 C.2 Truncated truth semantics

903 In order to develop the soundness argument for the interpretation of truncated formula  
 904 occurrences, we need to work with a slightly enriched notion of formula. We thus introduce  
 905 below a generalization of formulas and of the interpretation of Definition 33.

► **Definition 52.** *Marked pre-formulas* are built over the following syntax, where  $\theta$  is an ordinal:

$$\varphi, \psi ::= \mathbf{0} \mid \top \mid \varphi \oplus \psi \mid \varphi \& \psi \mid \perp \mid \mathbf{1} \mid \varphi \wp \psi \mid \varphi \otimes \psi \mid \mu X. \varphi \mid \nu^\theta X. \varphi \mid X \text{ with } X \in \mathcal{V}.$$

906 A marked formula is a marked pre-formula with no free variables. A marked formula  
 907 occurrence is given by a marked formula  $\varphi$  and an address  $\alpha$  and is written  $\varphi_\alpha$ .

908 ► **Definition 53.** Let  $\bigvee E$  be the truncation  $\alpha \mapsto \top$ . Let  $f$  be an operator over  $E$ . We define  
 909 the iterations of  $f$  starting from  $\bigvee E$  by:

- 910 ■  $f^0(\bigvee E) = \bigvee E$ ;
- 911 ■  $f^\delta(\bigvee E) = f(f^\lambda(\bigvee E))$  for every successor ordinal  $\delta = \lambda + 1$ ;
- 912 ■  $f^\delta(\bigvee E) = \bigcap_{\lambda < \delta} f^\lambda(\bigvee E)$  for every limit ordinal  $\delta$ .

913 We define the interpretation of a marked formula occurrence as follows, generalizing  
914 Definition 33:

915 ► **Definition 54.** Let  $\varphi_\alpha$  be a marked formula occurrence and  $\mathcal{E}$  be an environment, *i.e.*,  
916 a function mapping every free variable of  $\varphi$  to an element of  $E$ . We define  $[\varphi_\alpha]^\mathcal{E} \in \mathcal{B}$ , the  
917 interpretation of  $\varphi_\alpha$  in the environment  $\mathcal{E}$  as follows: if  $\alpha \in \text{Dom}(\tau)$  then  $[\varphi_\alpha]^\mathcal{E} = \tau(\alpha)$ ;  
918 otherwise:

- 919 ■  $[X_\alpha]^\mathcal{E} = \mathcal{E}(X)(\alpha)$ ,  $[\top_\alpha]^\mathcal{E} = \top$ ,  $[\mathbf{0}_\alpha]^\mathcal{E} = \mathbf{0}$ ,  $[\mathbf{1}_\alpha]^\mathcal{E} = \top$  and  $[\perp_\alpha]^\mathcal{E} = \mathbf{0}$ .
- 920 ■  $[(\varphi \otimes \psi)_\alpha]^\mathcal{E} = [\varphi_{\alpha.l}]^\mathcal{E} \wedge [\psi_{\alpha.r}]^\mathcal{E}$ , for  $\otimes \in \{\&, \otimes\}$ .
- 921 ■  $[(\varphi \oplus \psi)_\alpha]^\mathcal{E} = [\varphi_{\alpha.l}]^\mathcal{E} \vee [\psi_{\alpha.r}]^\mathcal{E}$ , for  $\oplus \in \{\oplus, \wp\}$ .
- $[(\mu X.\varphi)_\alpha]^\mathcal{E} = \text{lfp}(f)(\alpha)$  and  $[(\nu X^\theta.\varphi)_\alpha]^\mathcal{E} = f^\theta(\bigvee E)(\alpha)$  where  $f : E \rightarrow E$  is defined by:

$$f : h \mapsto \beta \mapsto \begin{cases} \tau(\beta) & \text{if } \beta \in \text{Dom}(\tau) \\ [\varphi_{\beta.i}]^{\mathcal{E}, X \mapsto h} & \text{otherwise.} \end{cases}$$

922 We denote by  $\mathcal{O}(\varphi, X, \mathcal{E})$  the operator  $f$  and we set  $[\varphi]^\mathcal{E} := (\alpha \mapsto [\varphi_\alpha]^\mathcal{E})$ .

923 As is standard, the least fixed point of  $f$  is guaranteed to exist in the above definition  
924 because  $[\varphi]^\mathcal{E}$  is a monotonic operator in the complete lattice  $E$ , obtained by lifting the lattice  
925  $\mathcal{B}$  where  $\mathbf{0} \leq \top$  with a pointwise ordering.

926 ► **Proposition 55 (Cousot & Cousot).** *Let  $\lambda$  the least ordinal such that the class  $\{\delta : \delta \in \lambda\}$   
927 has a cardinality greater than the cardinality  $\text{Card}(E)$ . Let  $f$  be a monotonic operator over  
928  $E$ . The sequence  $(f^\delta(\bigvee E))_{\delta \in \lambda}$  is a stationary decreasing chain, its limit  $f^\lambda(\bigvee E)$  is the  
929 greatest fixed point of  $f$ .*

930 Let  $\overline{F}$  be the marked formula occurrence obtained from  $F$  by marking every  $\nu$  binder by  
931  $\lambda$ . As a consequence of Proposition 55, one has that  $[F] = [\overline{F}]$ .

► **Lemma 56.** *Let  $\varphi, \psi$  be marked pre-formulas such that  $X \notin \text{fv}(\psi)$ . One has:*

$$[\varphi_\alpha]^\mathcal{E}, X \mapsto [\psi]^\mathcal{E} = [(\varphi[\psi/X])_\alpha]^\mathcal{E}.$$

932 **Proof.** The proof is by induction on  $\varphi$ . We treat only the cases where  $\varphi$  is a fixed point  
933 formula; the other cases are immediate.

934 Suppose that  $\varphi = \nu Y^\theta.\xi$  and let  $f = \mathcal{O}(\xi, Y, \mathcal{E}, X \mapsto [\psi]^\mathcal{E})$  and  $g = \mathcal{O}(\xi[\psi/X], Y, \mathcal{E})$ . By  
935 induction hypothesis one has  $f^\theta(\bigvee E) = g^\theta(\bigvee E)$ , which concludes this case.

Suppose now that  $\varphi = \mu Y.\xi$ , then we have:

$$\begin{aligned} [(\mu Y.\xi)_\alpha]^\mathcal{E}, X \mapsto [\psi]^\mathcal{E} &= \text{lfp}(\mathcal{O}(\xi, Y, \mathcal{E}, X \mapsto [\psi]^\mathcal{E}))(\alpha) \\ &\stackrel{*}{=} \text{lfp}(\mathcal{O}(\xi, Y, \mathcal{E}, X \mapsto [\psi]^\mathcal{E}, Y \mapsto h))(\alpha) \\ &\stackrel{IH}{=} \text{lfp}(\mathcal{O}(\xi[\psi/X], Y, \mathcal{E}))(\alpha) \\ &= [(\mu Y.\xi[\psi/X])_\alpha]^\mathcal{E} \end{aligned}$$

936 (\*) We are considering capture-free substitutions, hence  $Y \notin \text{fv}(\psi)$  and  $[\psi]^\mathcal{E}, Y \mapsto f = [\psi]^\mathcal{E}$ . ◀

937 An immediate consequence of this proposition is that the interpretation of a least fixed  
938 point formula is equal to the interpretation of its unfolding:

939 ► **Lemma 57.** *If  $\alpha \notin \text{Dom}(\tau)$ ,  $[(\mu X.\varphi)_\alpha]^\mathcal{E} = [(\varphi[\mu X.\varphi/X])_{\alpha.i}]^\mathcal{E}$*

**Proof.** We set  $f = \mathcal{O}(\varphi, X, \mathcal{E})$ . Let us notice first that for all  $\alpha \in \Sigma^*$ , one has  $[(\mu X.\varphi)_\alpha]^\mathcal{E} = \text{lfp}(f)(\alpha)$ . Indeed, one has the equality by definition when  $\alpha \notin \text{Dom}(\tau)$  and it is easy to prove it when  $\alpha \in \text{Dom}(\tau)$  since both sides are equal to  $\tau(\alpha)$ .

$$\begin{aligned} [(\mu X.\varphi)_\alpha]^\mathcal{E} &= \text{lfp}(f)(\alpha) \\ &= [\varphi_{\alpha.i}]^{\mathcal{E}, X \mapsto \text{lfp}(f)} \\ &= [\varphi_{\alpha.i}]^{\mathcal{E}, X \mapsto [\mu X.\varphi]^\mathcal{E}} \\ &= [(\varphi[\mu X.\varphi/X])_{\alpha.i}]^\mathcal{E} \end{aligned}$$

940

941 ► **Lemma 58.** *If  $[(\nu X^\theta.\varphi)_\alpha]^\mathcal{E} = \mathbf{0}$  and  $\alpha \notin \text{Dom}(\tau)$  then there is an ordinal  $\gamma < \theta$  s.t.*  
 942  *$[(\varphi[\nu X^\gamma.\varphi/X])_{\alpha.i}]^\mathcal{E} = \mathbf{0}$ .*

**Proof.** We set  $f = \mathcal{O}(\varphi, X, \mathcal{E})$ . If  $\theta$  is a successor ordinal  $\delta + 1$ , then:

$$\begin{aligned} [(\nu X^\theta.\varphi)_\alpha]^\mathcal{E} &= f^{\delta+1}(\bigvee E)(\alpha) \\ &= [\varphi_{\alpha.i}]^{\mathcal{E}, X \mapsto f^\delta(\bigvee E)} \\ &= [\varphi_{\alpha.i}]^{\mathcal{E}, X \mapsto [\nu X^\delta.\varphi]^\mathcal{E}} \\ &= [(\varphi[\nu X^\delta.\varphi/X])_{\alpha.i}]^\mathcal{E} \end{aligned}$$

943 We take  $\gamma$  to be the ordinal  $\delta$  and we have obviously that  $[(\varphi[\nu X^\gamma.\varphi/X])_{\alpha.i}]^\mathcal{E} = \mathbf{0}$ .  
 If  $\theta$  is a limit ordinal, then:

$$\begin{aligned} [(\nu X^\theta.\varphi)_\alpha]^\mathcal{E} &= f^\theta(\bigvee E)(\alpha) \\ &= \bigcap_{\beta < \theta} f^\beta(\bigvee E) \\ &= \bigcap_{\delta+1 < \theta} f^{\delta+1}(\bigvee E) \end{aligned}$$

944 Hence there is a successor ordinal  $\delta + 1$  such that  $[(\nu X^\theta.\varphi)_\alpha]^\mathcal{E} = f^{\delta+1}(\bigvee E)(\alpha)$  and we  
 945 continue as before. ◀

946 We prove easily the following lemma by induction on  $F$ :

947 ► **Lemma 59.** *Let  $F$  be an (unmarked) formula occurrence. One has  $[F^\perp] = [F]^\perp$ .*

948 We can finally establish our soundness result:

949 ► **Proposition (34).** *If  $\vdash \Gamma$  is provable in  $\mu\text{MALL}_\tau^\infty$ , then  $[F] = \top$  for some  $F \in \Gamma$ .*

950 **Proof.** If  $F$  is a marked formula occurrence, we denote by  $F^*$  the formula occurrence obtained  
 951 by forgetting the marking information.

952 Suppose that  $\vdash \Gamma$  has a  $\mu\text{MALL}_\tau^\infty$  proof  $\pi$  and that  $[F] = \mathbf{0}$  for all  $F \in \Gamma$ . We will  
 953 construct a branch  $\gamma = s_0 s_1 \dots$  of  $\pi$  and a sequence of functions  $f_0, f_1, \dots$  where  $f_i$  maps  
 954 every formula occurrence  $G$  of  $s_i$  to a marked formula occurrence  $f_i(G)$  such that  $[f_i(G)] = \mathbf{0}$   
 955 and  $f_i(G)^* = G$  unless  $G = \varphi_{\alpha.i}$  with  $\alpha \in \text{Dom}(\tau)$ . We set  $s_0 = \Gamma$  and  $f_0(F) = \bar{F}$ . One has  
 956  $[\bar{F}] = [F] = \mathbf{0}$ . Suppose that we have constructed  $s_i$  and  $f_i$ . We construct  $s_{i+1}$  depending  
 957 on the rule applied to  $s_i$ :

958 ■ If the rule is a logical rule,  $G$  being principal in  $s_i$ , we set  $G_m := f_i(G)$ , we have the  
 959 following cases:

- 960 ■ If  $G = H \wp K$ , then  $G_m$  is of the form  $G_m = H_m \wp K_m$ . We set  $s_{i+1}$  to be the  
 961 unique premise of  $s_i$ ,  $f_{i+1}(H) = H_m$  and  $f_{i+1}(K) = K_m$ . Since  $[G_m] = \mathbf{0}$  and  
 962  $[G_m] = [H_m] \vee [K_m]$ , one has  $[G_m] = \mathbf{0}$  and  $[K_m] = \mathbf{0}$ . For every other formula  
 963 occurrence  $L$  of  $s_{i+1}$  we set  $f_{i+1}(L) = f_i(L)$ .
- 964 ■ If  $G = H \oplus K$ , we proceed exactly in the same way as above.
- 965 ■ If  $G = H \otimes K$ , then  $G_m$  is of the form  $G_m = H_m \otimes K_m$ . Since  $[G_m] = \mathbf{0}$  and  $[G_m] =$   
 966  $[H_m] \wedge [K_m]$ , one has  $[H_m] = \mathbf{0}$  or  $[K_m] = \mathbf{0}$ . Suppose wlog that  $[H_m] = \mathbf{0}$ . We set  
 967  $s_{i+1}$  to be the premise of  $s_i$  that contains  $H$  and  $f_{i+1}(H) = H_m$ . For every other  
 968 formula occurrence  $L$  of  $s_{i+1}$  we set  $f_{i+1}(L) = f_i(L)$ .
- 969 ■ If  $G = H \& K$ , we proceed exactly in the same way as above.
- 970 ■ If  $G = \mu X.K$ , then  $G_m$  is of the form  $G_m = \mu X.K_m$ . We set  $s_{i+1}$  to be the unique  
 971 premise of  $s_i$  and  $f_{i+1}(K[G/X]) = K_m[G_m/X]$ . By Corollary 57 and since  $[G_m] = \mathbf{0}$ ,  
 972 one has  $[K_m[G_m/X]] = \mathbf{0}$ . For every other formula occurrence  $L$  of  $s_{i+1}$ , we set  
 973  $f_{i+1}(L) = f_i(L)$ .
- 974 ■ If  $G = \nu X.H$ , then  $G_m$  is of the form  $G_m = \nu X^\theta.K_m$ . Let  $s_{i+1}$  be the unique  
 975 premise of  $s_i$ . By corollary 58 and since  $[G_m] = \mathbf{0}$ , there is an ordinal  $\delta < \theta$  such that  
 976  $[K_m[\nu X^\delta.K_m/X]] = \mathbf{0}$ . We set  $f_{i+1}(H[G/X]) = K_m[\nu X^\delta.K_m/X]$  and for every other  
 977 formula occurrence  $L$  of  $s_{i+1}$ , we set  $f_{i+1}(L) = f_i(L)$ .
- 978 ■ Suppose that the rule applied to  $s_i$  is a cut on the formula occurrence  $G$ . By Lemma 59,  
 979 either  $[G] = \mathbf{0}$  or  $[G^\perp] = \mathbf{0}$ , suppose wlog that  $[G] = \mathbf{0}$ . We set  $s_{i+1}$  to be the premise of  
 980  $s_i$  containing  $G$ ,  $f_{i+1}(G) \equiv \overline{G}$  and for every other formula occurrence  $L$  of  $s_{i+1}$ , we set  
 981  $f_{i+1}(L) \equiv f_i(L)$ .
- 982 ■ If the rule applied to  $s_i$  is the rule  $(\tau)$  with a principal formula  $G = \varphi_\alpha$ , then  $\alpha \in \text{Dom}(\tau)$   
 983 and  $f_i(G) = \psi_\alpha$  where  $\psi^* = \varphi$ . Hence  $[f_i(G)] = \tau(\alpha)$ . By construction  $[f_i(G)] = \mathbf{0}$ , hence  
 984  $\tau(\alpha) = \mathbf{0}$  and  $[\tau(\alpha)_{\alpha.i}] = \mathbf{0}$ . We set  $s_{i+1}$  to be the unique premise of  $s_i$ .

985 Since  $\pi$  is a valid pre-proof, its branch  $\gamma$  must contain a valid thread  $t = F_0 F_1 \dots$ . Let  
 986  $\nu X.\varphi$  be the minimal formula of  $t$  and  $i_0 i_1 \dots$  be the sequence of indices where  $\nu X.\varphi$  gets  
 987 unfolded. By construction, for all  $k > 0$  one has  $f_{i_k}(F_{i_k}) = \nu X^{\theta_k}.G_k$  and the sequence of  
 988 ordinals  $(\theta_k)_k$  is strictly decreasing, which contradicts the well-foundedness of ordinals. ◀

989 We finally prove Proposition 36, generalized as follows:

990 ► **Proposition 60.** *Let  $\varphi_\alpha$  be a pre-formula occurrence compatible with  $\tau$  and containing no*  
 991  *$\nu$  binders, no  $\top$  and no  $\mathbf{1}$  subformulas. Let  $\mathcal{E}$  be an environment such that for all  $\beta \notin \text{Dom}(\tau)$ ,*  
 992  *$\mathcal{E}(X)(\beta) = \mathbf{0}$ . We have  $[\varphi_\alpha]^\mathcal{E} = \mathbf{0}$ .*

993 **Proof.** The proof is by induction on  $\varphi$ .

- 994 ■ The cases when  $\varphi = \mathbf{0}$  or  $\perp$  are trivial.
- 995 ■ If  $\varphi = X$ , then  $[X_\alpha]^\mathcal{E} = \mathcal{E}(X)(\alpha) = \mathbf{0}$  by hypothesis on  $\mathcal{E}$  and since  $\alpha \notin \text{Dom}(\tau)$  by  
 996 compatibility with  $\tau$ .
- 997 ■ If  $\varphi = \xi \odot \psi$ , where  $\odot \in \{\oplus, \wp\}$ , then  $[(\xi \odot \psi)_\alpha]^\mathcal{E} = [\xi_{\alpha.l}]^\mathcal{E} \vee [\psi_{\alpha.r}]^\mathcal{E}$ . Since  $(\xi \odot \psi)_\alpha$   
 998 is compatible with  $\tau$ , one has  $\alpha.l \notin \text{Dom}(\tau)$  and  $\alpha.r \notin \text{Dom}(\tau)$ . Indeed, if a formula  
 999 is compatible with a truncation  $\tau$ , then  $\tau$  cannot truncate a son of  $\oplus$  or a  $\wp$  node.  
 1000 We can thus apply our induction hypothesis, obtaining  $[\xi_{\alpha.l}]^\mathcal{E} = [\psi_{\alpha.r}]^\mathcal{E} = \mathbf{0}$ , hence  
 1001  $[(\xi \odot \psi)_\alpha]^\mathcal{E} = \mathbf{0}$ .
- 1002 ■ If  $\varphi = \xi \odot \psi$ , where  $\odot \in \{\&, \otimes\}$ , then  $[(\xi \odot \psi)_\alpha]^\mathcal{E} = [\xi_{\alpha.l}]^\mathcal{E} \wedge [\psi_{\alpha.r}]^\mathcal{E}$ . Since  $(\xi \odot \psi)_\alpha$   
 1003 is compatible with  $\tau$ , one has  $\alpha.l \notin \text{Dom}(\tau)$  or  $\alpha.r \notin \text{Dom}(\tau)$ . Indeed, if a formula is  
 1004 compatible with a truncation  $\tau$ , then  $\tau$  cannot truncate both sons of a  $\&$  or a  $\otimes$  node.  
 1005 We conclude by induction as before on the subformula that is not truncated, and which  
 1006 is thus still compatible with  $\tau$ .

1007 ■ If  $\varphi = \mu X.\psi$ , then  $[\mu X.B]^{\mathcal{E}} = \text{lfp}(f)(\tau)$  where  $f$  is as in the definition 33. By Cousot's  
 1008 theorem [9],  $[(\mu X.B)_{\alpha}]^{\mathcal{E}} = \bigvee_{\delta < \lambda} \varphi^{\delta}(\bigwedge E)(\alpha)$ . We show by an easy transfinite induction  
 1009 that for all  $\delta < \lambda$  and  $\beta \notin \text{Dom}(\tau)$ , we have  $\varphi^{\delta}(\bigwedge E)(\beta) = \mathbf{0}$ . This concludes the proof.
